## **Soil Development:**

**Soil Formation** Nico van Breemen, Peter Buurman, 2007-08-20 Soils form a unique and irreplaceable essential resource for all terrestrial organisms including man. Soils form not only the very thin outer skin of the earth's crust that is exploited by plant roots for anchorage and supply of water and nutrients. Soils are complex natural bodies formed under the influence of plants, microorganisms, and soil animals, water, and air from their parent material, i.e. solid rock or unconsolidated sediments. Physically, chemically, and mineralogically they usually differ strongly from the parent material and normally are far more suitable as a rooting medium for plants. In addition to serving as a substrate for plant growth, including crops and pasture, soils play a dominant role in the biogeochemical cycling of water, carbon, nitrogen, and other elements, influencing the chemical composition and turnover rates of substances in the atmosphere and the hydrosphere. Soils take decades to millennia to form. We tread on them and do not usually see their interior, so we tend to take them for granted. But improper and abusive agricultural management, careless land clearing, and reclamation, man-induced erosion, salinisation, and acidification, desertification, air and water pollution, and withdrawal of land for housing, industry, and transportation now destroy soils more rapidly than they can be formed.

*Factors of Soil Formation* Hans Jenny, 1994-01-01 Masterpiece offers a detailed discussion of the nature of the earth's terrestrial environment and a method of subdividing and studying it. 1941 edition.

**Modelling Soil Development Under Global Change** Peter Finke, 2024-03-14 Quantitative assessments of the effects of global change on soil development are mostly focused on soil carbon, some nutrients, pollutants, and soil water. Soil, however, is a complex entity with interacting biological, physical, and chemical processes that are rarely modelled in its entirety. Additionally, for the sake of simplicity, various soil properties are considered constants, whereas in reality they are not. Soil, as we observe it, is the resultant of many processes driven by varying boundary conditions, such as climate and organisms, including men. This is not different when we study global change; thus, modelling soil development under global change overlaps with modelling soil formation. This book gives an overview of what such a model should entail, with ample descriptions to use SoilGen, a simulation model to study pedogenesis.
