## **Topology And Maps:**

*Topology and Maps* T. Husain, 2012-12-06 This work is suitable for undergraduate students as well as advanced students and research workers It consists of ten chapters the first six of which are meant for beginners and are therefore suitable for undergraduate students Chapters VII X are suitable for advanced students and research workers interested in functional analysis This book has two special features First it contains generalizations of continuous maps on topological spaces e.g almost continuous maps nearly continuous maps maps with closed graph graphically continuous maps w continuous maps and a continuous maps etc and some of their properties The treatment of these notions appears here in Chapter VII for the first time in book form The second feature consists in some not so easily available nuptial delights that grew out of the marriage of topology and functional analysis they are topics mainly courted by functional analysts and seldom given in topology books Specifically one knows that the set  $C(X)$  of all real or complex valued continuous functions on a completely regular space  $X$  forms a locally convex topological algebra a fortiori a topological vector space in the compact open topology A number of theorems are known For example  $C(X)$  is a Banach space iff  $X$  is compact or  $C(X)$  is complete iff  $X$  is a  $k_r$  space and so on Chapters VIII and X include this material which to the regret of many interested readers has not previously been available in book form a recent publication Weir 06 does however contain some material of our Chapter X

**Explorations in Topology** David Gay, 2007-08-07 Explorations in Topology gives students a rich experience with low dimensional topology enhances their geometrical and topological intuition empowers them with new approaches to solving problems and provides them with experiences that would help them make sense of a future more formal topology course The innovative story line style of the text models the problems solving process presents the development of concepts in a natural way and through its informality seduces the reader into engagement with the material The end of chapter Investigations give the reader opportunities to work on a variety of open ended non routine problems and through a modified Moore method to make conjectures from which theorems emerge The students themselves emerge from these experiences owning concepts and results The end of chapter Notes provide historical background to the chapter's ideas introduce standard terminology and make connections with mainstream mathematics The final chapter of projects provides opportunities for continued involvement in research beyond the topics of the book Students begin to solve substantial problems right from the start Ideas unfold through the context of a storyline and students become actively involved The text models the problem solving process presents the development of concepts in a natural way and helps the reader engage with the material

**Grassmannians and Gauss Maps in Piecewise-Linear Topology** Norman Levitt, 2006-11-14 The book explores the possibility of extending the notions of Grassmannian and Gauss map to the PL category They are distinguished from classifying space and classifying map which are essentially homotopy theoretic notions The analogs of Grassmannian and Gauss map defined incorporate geometric and combinatorial information Principal applications involve characteristic class theory smoothing theory and the

existence of immersion satisfying certain geometric criteria e.g. curvature conditions. The book assumes knowledge of basic differential topology and bundle theory including Hirsch-Gromov-Phillips theory as well as the analogous theories for the PL category. The work should be of interest to mathematicians concerned with geometric topology, PL and PD aspects of differential geometry and the geometry of polyhedra. **Complements of Discriminants of Smooth Maps** V. This book is about new topological invariants of real and angle-valued maps inspired by Morse-Novikov theory, a chapter of topology which has recently raised interest outside of mathematics for example in data analysis, shape recognition, computer science and physics. They are the backbone of what the author proposes as a computational alternative to Morse-Novikov theory, referred to in this book as AMN theory. These invariants are on one

side analogues of rest points instantons and closed trajectories of vector fields and on the other side refine basic topological invariants like homology and monodromy They are associated to tame maps considerably more general than Morse maps that are defined on spaces which are considerably more general than manifolds They are computable by computer implementable algorithms and have strong robustness properties They relate the dynamics of flows that admit the map as Lyapunov map to the topology of the underlying space in a similar manner as Morse Novikov theory does *Space and Time* Emile Borel,1926
