Topology Of Closed One Forms:

Topology of Closed One-Forms Michael Farber, 2014-05-21 Viewed locally a closed one form on a manifold is a smooth function up to an additive constant. The global structure of a closed one form is mainly determined by its de Rham cohomology class. In this book Michael Farber studies fascinating geometrical, topological, and dynamical properties of closed one forms. In particular, he reveals the relations between their global and local features. In 1981, S. P. Novikov initiated a generalization of Morse theory in which instead of critical points of smooth functions, one deals with closed one forms and their zeros. The first two chapters of the book, written in textbook style, give a detailed exposition of Novikov theory, which now plays a fundamental role in geometry and topology. In the following chapters, the author describes the universal chain complex that lives over a localization in the sense of P. M. Cohn of the group ring and relates the topology of the underlying manifold with information about zeros of closed one forms. Using this complex, many different variations and generalizations of the Novikov inequalities are obtained, including Bott type inequalities for closed one forms, equivariant inequalities, and inequalities in K -theory. Topology of Closed 1-Forms on Manifolds with Boundary Tieqiang Tan, Li, 2009. The topological structure of a manifold can be effectively revealed by studying the critical points of a nice function assigned on it. This is the essential motivation of Morse theory, and many of its generalizations from a modern viewpoint. One fruitful direction of the generalisation of the theory is to look at the zeros of a closed 1-form, which can be viewed locally as a real function up to an additive constant, initiated by S. P. Novikov (see 32 and 33). Extensive literatures have been devoted to the study of so-called Novikov theory on closed manifolds, which consists of interesting objects such as Novikov complex, Morse-Novikov inequalities, and Novikov ring. On the other hand, the topology of a space, e.g., a manifold, provides vital information on the number of the critical points of a function. Along this line, a whole different approach was suggested in the 1930s by Lusternik and Schnirelman (25 and 26). M. Farber (9, 10, 11, and 12) generalised this concept with respect to a closed 1-form and used it to study the critical points and existence of homoclinic cycles on a closed manifold in much more degenerate settings. This thesis combines the two aspects in the context of closed 1-forms and attempts a systematic treatment on smooth compact manifolds with boundary in the sense that the transversality assumptions on the boundary are consistent. Thoroughly overall, the thesis employs a geometric approach to the generalisation of the existing results. **Integration of One-forms on P-adic Analytic Spaces. (AM-162)** Vladimir G. Berkovich, 2007. Among the many differences between classical and p -adic objects, those related to differential equations occupy a special place. For example, a closed p -adic analytic one-form defined on a simply connected domain does not necessarily have a primitive in the class of analytic functions. In the early 1980s, Robert Coleman discovered a way to construct primitives of analytic one-forms on certain smooth p -adic analytic curves in a bigger class of functions. Since then, there have been several attempts to generalize his ideas to smooth p -adic analytic spaces of higher dimension, but the spaces considered were invariably associated with algebraic varieties. This book aims to show

that every smooth p -adic analytic space is provided with a sheaf of functions that includes all analytic ones and satisfies a uniqueness property. It also contains local primitives of all closed one-forms with coefficients in the sheaf that in the case considered by Coleman coincide with those he constructed. In consequence, one constructs a parallel transport of local solutions of a unipotent differential equation and an integral of a closed one-form along a path so that both depend nontrivially on the homotopy class of the path. Both the author's previous results on geometric properties of smooth p -adic analytic spaces and the theory of isocrystals are further developed in this book, which is aimed at graduate students and mathematicians working in the areas of non-Archimedean analytic geometry, number theory, and algebraic geometry.

Geometry of Foliations Philippe Tondeur, 1997-05. Surveys research over the past few years at a level accessible to graduate students and researchers with a background in differential and Riemannian geometry. Among the topics are foliations of codimension one, holonomy, Lie foliations, basic forms, mean curvature, the Hodge theory for the transversal Laplacian, applications of the heat equation method to Riemannian foliations, the spectral theory, Connes' perspective of foliations as examples of non-commutative spaces, and infinite-dimensional examples. The bibliographic appendices list books and surveys on particular aspects of foliations, proceedings of conferences and symposia, all papers on the subject up to 1995, and the numbers of papers published on the subject during the years 1990-95.
