## **Theoretical Geomorphology:**

Theoretical Geomorphology Adrian E. Scheidegger, 2013-04-17 The surface features of the Earth are commonly split into two categories the first of which comprises those features that are due to processes occurring inside the solid Earth endogenetic features and the second those that are due to processes occurring outside the solid Earth exogenetic features Specifically the endogenetic features are treated in the science of geodynamics the exogenetic features in the science of geomorphology I have treated the theoretical aspects of the endogenetic features in my Principles of Geodynamics and it is my aim to supplement my earlier book with a discussion of the theory of the exogenetic features It is my hope that the two books will together present a reasonably coherent if necessarily incomplete account of theoretical geology Contrary to endogenetic phenomena exogenetic processes can often be directly observed as they occur the action of a river the development of a slope and the evolution of a shore platform are all sufficiently rapid so that they can be seen as they take place This has the result that in geomorphology one is generally on much less speculative ground regarding the mechanics of the processes at work than one is in geodynamics An Introduction to Theoretical Geomorphology Colin E. Thorn, 1988

**An Introduction to Theoretical Geomorphology** C. Thorn, 2012-02-22 This book stems from the belief that undergraduate and many graduate students in geomorphology are taught far too little about the theoretical foundation of the discipline This is a tragic oversight because all disciplines exist solely by virtue of a body of theory furthermore all substantive research must of necessity be directed at improving this body of theory While the centrality of theory is a characteristic of all science it appears that it is fieldwork that has achieved sacrosanct status in geomorphology The supreme standing of fieldwork would seem at first sight to be supported by such comments as that cited by Ager 1984 p 42 My old professor the great H H Read once said The best geologist is other things being equal he who has seen the most rocks The key issue in Read's comment is obviously other things being equal what are these other things For they will be just as applicable to geomorphology as to geology at large One is certainly personal ability but another critical component is the individual's knowledge of relevant theory Pursuit of theoretical knowledge is not generally a favored activity in geomorphology a situation epitomized by Chorley's 1978 p 1 one liner Whenever anyone mentions theory to a geomorphologist he instinctively reaches for his soil auger Process Models and Theoretical Geomorphology M. J. Kirkby, 1994-03-08 Multinational contributors present articles on a wide range of themes but with important convergences of interest on critical topics A group of papers on tectonic and general approaches reviews the role of randomness in process models and provides a novel theoretical analysis of the relationships between tectonic and erosional forces Selections on channel processes reflect current interest in gravel bed rivers related to their widespread occurrence in mountain areas and in braided systems Articles on valley heads bring together views from several sometimes conflicting research approaches The final group of contributions illustrate the range of problems to which theoretical methods in geomorphology can now be applied

An Introduction to Theoretical Geomorphology C. Thorn, 2014-01-14 This book stems from the belief that undergraduate and many graduate students in geomorphology are taught far too little about the theoretical foundation of the discipline This is a tragic oversight because all disciplines exist solely by virtue of a body of theory furthermore all substantive research must of necessity be directed at improving this body of theory While the centrality of theory is a characteristic of all science it appears that it is fieldwork that has achieved sacrosanct status in geomorphology The supreme standing of fieldwork would seem at first sight to be supported by such comments as that cited by Ager 1984 p 42 My old professor the great H H Read once said The best geologist is other things being equal he who has seen the most rocks The key issue in Read's comment is obviously other things being equal what are these other things For they will be just as applicable to geomorphology as to geology at large One is certainly personal ability but another critical component is the individual's knowledge of relevant theory Pursuit of theoretical knowledge is not generally a favored activity in geomorphology a situation epitomized by Chorley's 1978 p 1 one liner Whenever anyone mentions theory to a geomorphologist he instinctively reaches for his soil auger      *Geomorphology of Lake-Catchment Systems* Kenji Kashiwaya, 2017-07-24 This book presents the study of limnogeomorphology in which past proxy data such as lacustrine sediments with information on landform development can be linked to modern observed data acquired by instruments including hydro geomorphological and sedimentary data Traditionally in the field of earth sciences it has been thought that geophysical studies dealing mainly with the present process were not smoothly linked to geological studies that originated from historical studies Although such earth surface process studies are closely related to those on historical landform development in the field of geomorphology they have been studied separately Those two geomorphology studies correspond to process geomorphology dynamic geomorphology and historical geomorphology There have been some attempts to combine them however they lacked past quantitative records available for further analyses In the study of limnogeomorphology proxy data can be converted to quantitative information to be utilized in future environmental discussions This book also covers information not only on large lake catchment systems but on small systems Those include long term and short term and large scale and small scale environmental changes in east Eurasia such as Lake Baikal Lake Khuvsgul Lake Biwa and small lakes in Japan Mongolia China and Korea      Theoretical geomorphology, 2nd revised ed A. E. Scheidegger, 1970      **Integration of Computer Modeling and Field Observations in Geomorphology** J.F. Shroder, M.P. Bishop, 2003-09-26 The integration of classic field gathered data with new computer models has allowed many new advances in geomorphology which the 31st Binghamton Millennium Symposium 2000 presents in this latest of the well known Binghamton book series the Integration of Computer Modeling and Field Observations in Geomorphology Conceptual models have been most commonly inferred from analyses of topography and investigator perspectives derived from fieldwork The main stumbling blocks to understanding surface

processes their interactions temporal changes and resulting landforms are the difficulty of observation geological timescales involved spatial scale dependencies and the inability to attribute differences to either process or age Physically based computer models have thus become essential tools primarily because of their ability to explore spatial and temporal trends and to determine the sensitivity of physical inputs to change without the difficulties of identification and generalization associated with the complexity of field studies Thus the combination of both methods or the integration of field methods with computer modeling become a very powerful mechanism for robust understanding This new book presents topics on fluvial processes of overland and channelized flow in arid humid and periglacial areas of high and low relief as well as work on interlinked biogeographic and geomorphic fluctuations in alpine terrain and ground penetrating radar of coastal geomorphology Issues of long term evolution of drainage networks are addressed in natural systems as well as stream table environments and terrain analyses characterize surficial and subsurface geomorphic features by using GIS and remote sensing Botanical and biogeomorphologic controls of landforms are assessed along with issues of scientific visualization cartographic representation DEMs spatial analyses and scale dependencies Theoretical Geomorphology. With 163 Figures, 1961 **Geomorphological Models** Frank Ahnert, 1987 Six papers of this volume deal with slope processes and slope form A model study by Kirkby analyses the relative importance of wash processes and landslides for the growth of slope hollows Torri discusses soil detachability in theoretical terms while Ai in an investigation of landforms on the Colorado Plateau Schmidt points out structural and lithological factors that require special attention in model designs De Ploey Ergenzinger shows the underlying order in the development of seemingly disorderly braided channel patterns BAND investigates the lateral migration and change of the junction angle during the development of tributary streams and Wieczorek presents a general function for the geometry of meander bends The next group of papers dealing with questions related to water and sediment yields is led off by Yair Enzel with a comparison of these variables in the arid and the semi arid parts of the Negev Ichim Radoane have made a multivariate investigation of ninety nine small catchments in Romania and RAWAT discusses the present state of modelling knowledge related to water and sediment More abstract is Millers methodological assessment of the theoretically important latent variables that underlie the indicator variables which we observe in water and sediment studies As the concluding section there are four papers on general theoretical considerations Based on the mass continuity equation Hardisty describes the local rate of surface lowering as a transport response function which may serve to characterise the stability of the system involved Haigh urges that an investigation of natural systems should include recognition of their hierarchical structure and Trofimov offers an appraisal of geomorphological prediction In the last paper Scheidegger seeks to condense the factors and interactions that affect the evolution of landforms into a set of five fundamental principles The papers span a wide range of topics Their contents may also reflect to some extent the various stages of methodological advancement and the various directions of geomorphological research that exist in different parts of

the world today However common to all papers is the aim to contribute to the strengthening of the ties between theoretical and empirical geomorphology This found expression also in the long intensive and lively discussion which followed the presentation of virtually every paper at the meeting in Aachen Theoretical Geomorphology , **The Place of Geography** Tim Unwin,2013-12-16 The Place of Geography is designed to provide a readable and yet challenging account of the emergence of geography as an academic discipline It has three particular aims it seeks to trace the development of geography back to its formal roots in classical antiquity provides an interpretation of the changes that have taken place in geographical practice within the context of Jurgen Habermas critical theory and thirdly describes how the increasing separation of geography into physical and human parts has been detrimental to our understanding of critical issues concerning the relationship between people and environment Scientific Bulletin United States. Office of Naval Research,1979-10 Scientific Bulletin ,1979 **Inventing the Earth** Barbara Kennedy,2008-04-15 This book chronicles how successive generations of natural philosophers geologists and geomorphologists have come to invent the view of the Earth over the past 250 years Chronicles how successive generations of natural philosophers geologists and geomorphologists have come to invent different views of the Earth over the last 250 years Uses as its central viewpoint changing ideas about the significance of the action of rain and rivers on the Earth s surface Shows how our contemporary truths have come to be accepted and exposes the frailty of even the most impeccably scientific visions of the Earth
