A. Aizerman,2016-10-27 Theory of Automatic Control focuses on the theory of automatic control including controllers models control processes and analysis of systems The book first offers information on the general introduction to automatic controllers and the construction of a linear model control system and the initial material for its analysis Discussions focus on astatic controllers of indirect action floating feedback controllers of discontinuous action static characteristics of elements and of systems and frequency characteristics of a linear element and of the linear model of a system The text then ponders on the stability of the linear model of an automatic control system and the construction and evaluation of the processes in the linear model of a system of automatic control Topics include construction of the process from the transfer function of the system construction of the control process from the frequency characteristics of the system and analysis of systems with random disturbances given statistically The publication takes a look at auto and forced oscillation in non linear systems including approximate determination of forced oscillations in the presence of an external periodic action and determination of the auto oscillations in the case of auto resonance The manuscript is a dependable reference for readers interested in the theory of automatic control      *Automatic Control Systems/Robotics Problem Solver* ,      **Manual and Automatic Control** Charles R. Kelley,1968      **Control Theory** James R. Leigh,2004 This revised edition addresses recent developments in the

field of control theory It discusses how the rise of Hoo and similar approaches has allowed a combination of practicality rigour and user interaction to be brought to bear upon complex control problems The book also covers the rise of AI techniques

*The Dynamics of Automatic Control Systems* E. P. Popov, 2014-05-09 The Dynamics of Automatic Control Systems focuses on the dynamics of automatic control systems and the fundamental results of the theory of automatic control The discussion covers theoretical methods of analysis and synthesis of automatic control systems common to systems of various physical natures and designs Concrete examples of the simplest functional circuits are presented to illustrate the principal ideas in the construction of automatic control systems and the application of the theoretical methods Comprised of 19 chapters this book begins by describing different forms of automatic control systems with emphasis on open and closed loop automatic systems The reader is then introduced to transients in automatic regulation systems methods for improving the regulation process and some problems in the theory of automatic regulation Subsequent chapters deal with linearization and transformation of the differential equations of an automatic regulation system stability criteria for ordinary linear systems equations of systems with delay and with distributed parameters and equations of nonlinear automatic regulation systems The oscillations and stability of nonlinear systems are also considered This monograph will be of interest to engineers and students
