

Nonlinear Oscillation

Up until now, we've been considering the differential equation for the (damped) harmonic oscillator,

$$\ddot{y} + 2\beta\dot{y} + \omega^2 y = \mathcal{L}_y y = f(t). \quad (1)$$

Due to the linearity of the differential operator on the left side of our equation, we were able to make use of a large number of theorems in finding the solution to this equation. In fact, in the last few lectures, we've pretty much been able to solve this equation for any realistic case we could imagine.

However, we know that this equation came from an approximation - we've been assuming that the potential energy function of the spring can be written as

$$U(y) = \frac{1}{2}ky^2. \quad (2)$$

While in many cases this is an incredibly good approximation, we may wonder how the the addition of higher order terms might affect the behaviour of our system. For example, we could imagine taking one more term in a hypothetical Taylor series expansion which defines $U(y)$, so that

$$U(y) = \frac{1}{2}ky^2 + \frac{1}{6}\gamma y^3. \quad (3)$$

A plot of this potential energy function is shown in Figure 1.

This is not, however, a particularly nice potential energy function to work with, because it is **unstable**. Because the cubic term we have added is an odd function, then for large negative values of y , assuming that $\gamma > 0$, we find

$$U(y \rightarrow -\infty) = -\infty, \quad (4)$$

instead of positive infinity. For the case that $\gamma < 0$, we find similar behaviour as we move in the opposite direction. The implication of this is that any particle subject to this potential energy function with a total energy larger than

$$E_c = \frac{2}{3} \frac{k^3}{\gamma^2} \quad (5)$$

will escape towards negative infinity, and never come back. This is also shown in Figure 1. While this may indeed describe some physical systems, it does not do a good job of modelling the type of system we are interested in, which is reasonably small oscillations around an equilibrium point.

For this reason, we should add at least one more term to the Taylor series expansion of the potential,

$$U(y) = \frac{1}{2}ky^2 + \frac{1}{6}\gamma y^3 + \frac{1}{24}\lambda y^4. \quad (6)$$

For $\lambda > 0$, this now describes a stable potential energy function. A plot of this improved potential energy expansion is shown in Figure 2. Notice that despite
