Thermal Solid Waste:

A Thermal Recycling System Using Municipal Solid Waste for the City of Sacramento Nayan Manherlal Vora,1974 Thermal Solid Waste Utilisation in Regular and Industrial Facilities Lucjan Pawlowski,Marzenna R. Dudzinska,Marjorie A. Gonzales,2012-12-06 Proceedings of the International Workshop Thermal Solid Waste Utilization in Regular and Industrial Facilities held in Kazimierz Dolny Poland November 28 30 1999 In recent years industrial and urban growth has resulted in growing volumes of nondegradable wastes and this volume focuses on the technologies related to recycling and material reuse which are now being favoured over land disposal There is an overview on waste utilisation in industrial facilities particularly cement kilns from an ecological as well as technological aspect and some innovative solutions of pyrolytic and plasma reactors used for hazardous wastes combustion *Thermal Processing and Land Disposal of Solid Waste* United States. Environmental Protection Agency,1974 Thermal Conversion Systems for Municipal Solid Waste H. Lanier Hickman,1984 **Heat Extraction from Municipal Solid Waste Landfills** Leticia Maria Nocko,2019 Municipal solid waste MSW in landfills can reach temperatures greater than 50 C that may be sustained for several decades due to methanogenic bacterial activity The generated heat is an alternative energy source that can be exploited for direct heating of nearby infrastructure or for augmenting industrial processes However the proper design of heat extraction systems for landfills requires in situ measurements of MSW thermal properties and knowledge of the process of heat generation within the waste Accordingly the main objective of this study is to understand the processes governing heat generation and heat extraction in MSW and to characterize the thermal properties of the waste To reach this objective a new MSW landfill cell at the Sycamore Landfill in Santee California was instrumented with temperature sensors and geothermal heat exchangers installed at three different elevations in the cell during waste placement The spatial and temporal evolution of the waste temperature was monitored during 13 months of a self heating period followed by a 17 day heat extraction thermal response test and lastly a 3 month temperature recovery period The data collected during the monitoring was analyzed using three different methods of increasing complexity an infinite line source analysis a two dimensional inverse analysis using a finite difference model with simplified heat transfer boundary conditions and a three dimensional inverse analysis using a finite element model for heat transfer and nonisothermal pipe flow The estimated values of in situ thermal conductivity and thermal diffusivity of the MSW were consistent with values on the higher range of those obtained from laboratory tests on MSW reported in the literature The data also suggests a dependence of the heat generation rate on the temperature of the surrounding waste similar to that observed for methanogenic bacterial activity The experimental and simulation results constitute the basis for the design of geothermal heat exchange systems in MSW landfills The successful implementation of the heat exchange system in MSW landfill indicates that similar systems can be used for long term heat extraction or for maintenance of waste temperatures to enhanced methane generation or waste settlement or to protect landfill liner or cover
