**Select Thermodynamic Models for Process Simulation** Jean-Charles de Hemptinne, Jean-Marie Ledanois, 2012 The selection of the most adequate thermodynamic model in a process simulation is an issue that most process engineer has to face sooner or later This book conceived as a practical guide aims at providing adequate answers by analysing the questions to be looked at The analysis first chapter yields three keys that are further discussed in three different chapters 1 A good understanding of the properties required in the process and their method of calculation is the first key The second chapter provides to that end in a synthetic manner the most important equations that are derived from the fundamental principles of thermodynamics 2 An adequate description of the mixture which is a combination of models and parameters is the second key The third chapter makes the link between components and models both from a numerical parameterisation and physical molecular interactions point of view Finally 3 a correct view of the phase behaviour and trends in regard of the process conditions is the third key The fourth chapter illustrates the phase behaviour and makes model recommendations for the most significant industrial systems A decision tree is provided at the end of this chapter In the last chapter the key questions are reviewed for a number of typical processes This book is intended for process engineers who are not specialists of thermodynamics but are confronted with this kind of problems and need a reference book as well as process engineering students who will find an original approach to thermodynamics complementary of traditional lectures

Metallurgy and Design of Alloys with Hierarchical Microstructures Krishnan K. Sankaran,Rajiv S. Mishra,2017-06-14 Metallurgy and Design of Alloys with Hierarchical Microstructures covers the fundamentals of processing microstructure property relationships and how multiple properties are balanced and optimized in materials with hierarchical microstructures widely used in critical applications The discussion is based principally on metallic materials used in aircraft structures however because they have sufficiently diverse microstructures the underlying principles can easily be extended to other materials systems With the increasing microstructural complexity of structural materials it is important for students academic researchers and practicing engineers to possess the knowledge of how materials are optimized and how they will behave in service The book integrates aspects of computational materials science physical metallurgy alloy design process design and structure properties relationships in a manner not done before It fills a knowledge gap in the interrelationships of multiple microstructural and deformation mechanisms by applying the concepts and tools of designing microstructures for achieving combinations of engineering properties such as strength corrosion resistance durability and damage tolerance in multi component materials used for critical structural applications Discusses the science behind the properties and performance of advanced metallic materials Provides for the efficient design of materials and processes to satisfy targeted performance in materials and structures Enables the selection and development of new alloys for specific applications based upon evaluation of their microstructure as illustrated in this work

Saxena,2013-07-10 The use of thermodynamic databases permits the calculation of equilibrium phase diagrams of many important industrial systems An assessed thermodynamic database based on the results of decades of conducting experiments and calorimetric measurements is at the core of all industrial and scientific enquiries An internally consistent database is assessed built by using the thermochemical calorimetric data in producing the results of phase equilibrium experiments The procedure is usually referred to as the Calphad method In equilibrium calculations the temperature and composition variables are standard but the inclusion of the important variable pressure requires more complicated models for equations of state The latter require pressure volume temperature data on materials that are not so

common Similarly while there is ample data on binary and some ternary solutions the multicomponent and multisite models become very cumbersome to deal with Existing thermodynamic data permit us to draw many interesting phase diagrams such as the binary silicides Mn Si W Si and carbothermal reduction of silica and iron at extreme pressures Many of the currently existing phase diagrams are not based on actual in situ crystal structures at the appropriate temperature or pressure An example of Al Fe is given
