Thrust Plate Hip Prosthesis:

The Thrust Plate Hip Prosthesis A H Huggler, Hilaire A C Jacob, 1996-11-04 The thrust plate prosthesis is a new type of hip prosthesis which maintains the physiological loading pattern of the bone Experimental stress analysis of the proximal femur led to the development of this device and clinical results over a period of more than 12 years confirm the sound biomechanical concept on which it is based Conventional prostheses of the stem type are still prone to loosening and subsequent revision operations which are surgically particularly demanding The thrust plate prosthesis in contrast allows a revision procedure if at all necessary to be performed with the same ease as a primary implantation This together with the fact that bone stock is preserved makes it especially attractive for use in physiologically active and young patients More than 150 figures 16 of which are in colour illustrate details in the development of the device and the clinical observations made by a group of participants in a pilot study This book introduces the thrust plate prosthesis in detail to the hip surgeon It is an accurate account of the long and laborious effort involved in realizing a project that was born out of critical observations

The Thrust Plate Hip Prosthesis Arnold H. The Thrust Plate Hip Prosthesis A.H. Huggler, Hilaire A.C. Jacob, 1996-11-04 As is probably the case with all successful innovations the unique design of the thrust plate prosthesis TPP was not born of a sudden fancy for a radically different hip joint replacement but emerged from elaborate biomechanical investigations on the loosening of conventional intramedullarily anchored hip prosthesis shafts In the 1970s hip revisions due to loosening of the prostheses became a burden to patients not only physically and psychologically but also economically This meant that it also became a matter of daily concern to the orthopaedic surgeon who then had to cope with new previously unknown problems Loosening processes were detected within 5 years of implantation in up to 25% of cases While implant loosening were considered to be the result of incorrect handling of materials we felt that a number of details still had to be considered in regard to the behavior of the entire bone prosthesis complex and the action of mechanical forces

EORS, European Orthopaedic Research Society LEYVRAZ,2002-01-01 **The Cementless Fixation of Hip Endoprostheses** E. Morscher,2012-12-06 The main problem with regard to alloplastic joints is the loosening of the implant Twenty years ago Charnley first introduced bone cement to hip surgery enabling total hip replacement to be practised on a larger scale There is no question however that new approaches must be found to solving the problems of implant loosening either by developing a new type of cement or by directly anchoring the implant without using cement Much research has been done in this direction in recent years The methods which have already been tested or are currently being tested were presented and discussed at a symposium on Cementless Fixation of Endoprostheses organized by the Orthopaedic Clinic of the University of Basel and held on 24-26 June 1982 Various possible approaches which might be realized in practice were discussed in a relaxed atmosphere In addition to the biomechanical bases of cementless fixation of endoprostheses the various models were discussed with special regard to their biocompatibility physical characteristics design clinical applicability and previous clinical experience This book contains the papers delivered at this symposium
