

Holography

- Holography is a technique that creates three-dimensional images called holograms using laser lights
- It works by recording light scattered from an object and reconstructing it to display a 3D image
- Unlike traditional photography, holography captures both the intensity and phase of light, providing depth information
- The process involves using beamsplitters, mirrors, and photographic plates or digital sensors
- Holography has applications in security, data storage, and art

Practical example: Lasers

- Holography often relies on lasers to create and view detailed three-dimensional images
- Lasers provide the coherent light necessary to record high-resolution holograms
- In everyday life, this technology is used in various applications, from security features on credit cards to intricate holographic art displays
- The precision and consistency of laser light allow holograms to reconstruct light waves from an object, making it appear almost magically in three dimensions
