S. Hesthaven, 2001 We present an ab initio development of a convergent high order accurate scheme for the solution of linear conservation laws in geometrically complex domains As our main example we present a detailed development and analysis of a scheme suitable for the time domain solution of Maxwell's equations in a three dimensional domain The fully unstructured spatial discretization is made possible by the use of high order nodal basis employing multivariate Lagrange polynomials defined on the triangles and tetrahedra Careful choices of the unstructured nodal grid points ensure high order spectral accuracy while the equations themselves are satisfied in a discontinuous Galerkin form with the boundary conditions being enforced weakly through a penalty term Accuracy stability and convergence of the semi discrete approximation to Maxwell's equations is established rigorously and bounds on the global divergence error are provided Concerns related to efficient implementations are discussed in detail This sets the stage for the presentation of examples verifying the theoretical results as well as illustrating the versatility flexibility and robustness when solving two and three dimensional benchmarks in computational electromagnetic Pure scattering as well as penetration is discussed and high parallel performance of the

scheme is demonstrated      *Development of K-version of the Finite Element Method* Junuthula Narasimha Reddy,2006 This report summarizes the research carried out under Grant F49620 03 1 0201 on the development of least squares based finite element models of viscous compressible and incompressible flows as well as shear deformable plates and shells The main objective of this research was to develop a robust and accurate computational methodology based on least squares variational principles for the numerical solution of the equations governing plates and shells and viscous incompressible and compressible fluid flows The use of least squares principles leads to a variationally unconstrained minimization problem where compatibility conditions between approximation spaces such as inf sup conditions never arise Furthermore the resulting linear algebraic problem will always have a symmetric positive definite SPD coefficient matrix allowing the use of robust and fast preconditioned conjugate gradient methods for its solution In this research the basic theory of least squares finite element formulations of the equations governing viscous incompressible flows and shear deformable theories of plate and shell structures was carried out and their application through a variety of benchmark problems was illustrated In the case of fluid flows penalty least squares finite element models using high p levels and low penalty parameters were developed as a good alternative to mixed least squares finite element models also developed in the research
