Slow Potential Changes In The Brain Brain Dynamics S:

Slow Potential Changes in the Brain Haschke, Speckmann, 2012-11-28 DC potential changes comprising fast fluctuations and slow shifts represent objective concomitants of neuronal processes in the brain. They can be recorded not only in animals but also in humans under various conditions. As far as slow brain potentials are concerned, exciting results have been detected with respect to their correlation to psychophysiological events. Although a large amount of data has been accumulated by psychophysiological, neurophysiological, and other scientists, the neurophysiological basis of these field potentials is still not clear and remains controversial. Scientists from European countries participated in an interdisciplinary symposium in the summer of 1990, July 2 to 6, at the Friedrich Schiller University in Jena, which covered the field of slow brain potentials from the psychophysiological to the cellular level, including glial cells and microenvironment. From this conference, the idea derived to present an up-to-date overview on important aspects of the field. The introductory remarks are given to elucidate what is thought to be a generator of slow potentials of the brain. The large number of sources, implications of the inverse problem to analyze field potentials, are taken into account. *Oscillatory Event-Related Brain Dynamics* Christo Pantev, Thomas Elbert, Bernd Lütkenhöner, 2013-11-21 How does the brain code and process incoming information? How does it recognize a certain object? How does a certain Gestalt come into our awareness? One of the key issues to conscious realization of an object of a Gestalt is the attention devoted to the corresponding sensory input which evokes the neural pattern underlying the Gestalt. This requires that the attention be devoted to one set of objects at a time. However, the attention may be switched quickly between different objects or ongoing input processes. It is to be expected that such mechanisms are reflected in the neural dynamics. Neurons or neuronal assemblies which pertain to one object may fire possibly in rapid bursts at a time. Such firing bursts may enhance the synaptic strength in the corresponding cell assembly and thereby form the substrate of short-term memory. However, we may well become aware of two different objects at a time. How can we avoid that the firing patterns which may relate to say a certain type of movement columns in V5 or to a color V4 of one object do not become mixed with those of another object? Such a blend may only happen if the presentation times become very short, below 20-30 ms. One possibility is that neurons pertaining to one cell assembly fire synchronously. Then different cell assemblies firing at different rates may code different information. *Slow Potential Changes in the Brain* Haschke, Speckmann, 1993-01-01 DC potential changes comprising fast fluctuations and slow shifts represent objective concomitants of neuronal processes in the brain. Neuronal mechanisms of epileptogenesis Roberto Di Maio, 2015-01-13 Several types of brain injuries are causes of acquired temporal lobe epilepsy TLE The seizure free latent period that often follows the brain injury is of unknown mechanistic significance but is commonly considered as the epileptogenic period characterized by gradual pathogenic processes leading to the onset of clinically detectable epilepsy Acute convulsive status epilepticus SE is often associated with an adverse developmental outcome characterized by learning disabilities related to the cumulative effects of seizures and development of TLE The symptomatic manifestations of TLE appear only after a widespread irreversible damage of entorhinal cortex and hippocampus the brain area most affected by this disease These pathological features of TLE reduce the possibility of successful therapeutic approaches often rendering the disease refractory The difficult clinical management of chronic TLE and the limited success rate of surgical approaches increase the incapacitating nature of this specific epileptic disorder Prevention of TLE with an appropriate intervention after a known inciting event in the case of acquired epilepsy might represent the most ambitious goal in the clinical treatment of this epileptic disorder but has been largely unsuccessful to this point Clinical trials aimed at prevention of chronic epilepsy have often produced negative disappointing results However in most cases these studies ultimately evaluated the downstream clinical manifestations failing to monitor early specific molecular epileptogenic events Therefore elucidation of the underlying mechanisms of epileptogenesis and their time

course s are essential The primary purpose of this topic is to collect scientific contributions providing novel insights in the cellular and molecular mechanisms of epileptogenesis as potential targets for innovative therapeutic approaches aimed at preventing the chronic epileptic disorder
