

The Vascular System

What is the vascular system?

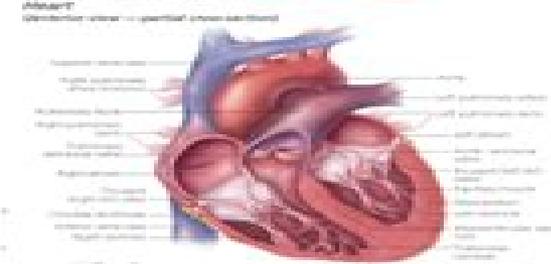

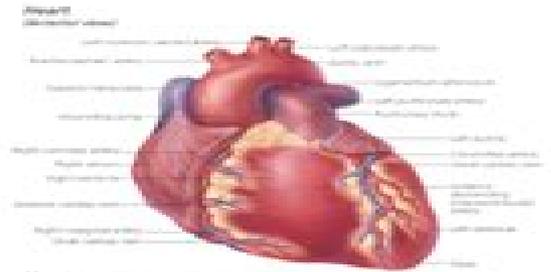

The vascular system is a network of blood vessels that transport blood throughout the body. It consists of the heart, arteries, veins, and capillaries. The system is responsible for delivering oxygen and nutrients to tissues and removing waste products.

Molecular system circulations

Artery	Vein
Thick wall	Thin wall
Small lumen	Large lumen
High pressure	Low pressure
Carries oxygenated blood	Carries deoxygenated blood

The heart

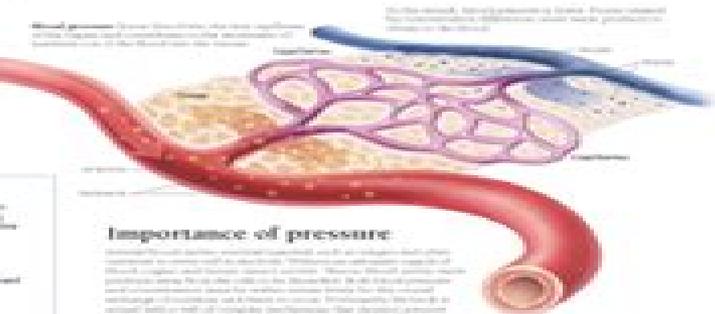

The heart is a muscular organ that pumps blood throughout the body. It consists of four chambers: the right and left atria and ventricles. The heart is located in the chest cavity, between the lungs.

Typical artery (cross-section)

Blood vessels

Blood vessels are the network of tubes that carry blood throughout the body. They are divided into arteries, veins, and capillaries. Arteries carry oxygenated blood away from the heart, while veins carry deoxygenated blood back to the heart.

Importance of pressure

Blood pressure is the force exerted by the blood against the walls of the blood vessels. It is essential for the flow of blood through the vascular system. High blood pressure can damage the vessels and lead to heart disease, while low blood pressure can result in inadequate blood flow to tissues.

Arterial valve (aortic)

Arterial valves are located in the arteries to prevent backflow of blood. The aortic valve is the largest of these valves and is located at the base of the aorta. It consists of three leaflets that open and close in response to the pressure changes in the blood.
