Lister, Andrew J. Wellings, 1987-06-24 Ada is unquestionably one of the most significant programming languages to emerge in the last decade The manner of its inception and support by the US Department of Defense DoD ensures that it will be used extensively for the indefinite future in programming large and complex systems The growing availability of compilers means that many organisations are already committed to using the language for sizable and significant applications As a perhaps inevitable result of its design goals Ada is a large language It has Pascal like control and type constructs a mechanism for exception handling a package structure for information hiding decomposition and separate compilation facilities for low level programming and a tasking model of concurrency It is perhaps this last area that has generated most debate criticism and disagreement The purpose of this book is to review the tasking model in the light of the extensive analysis and comment which has appeared in the literature The review is necessarily wide ranging including discussion of Ada as a general purpose concurrent programming language Ada as a language for embedded and distributed systems implementation issues with particular reference to distributed systems formal semantics specification and verification proposed language modifications By consolidating this discussion within the confines of a single review potential users of the tasking facility are enabled to familiarise themselves with all the factors which may impinge upon the performance reliability and correctness of their software The book also provides a focus for any debate on modifications to the Ada language or developments from it **Distributed Computer Systems** H. S. M. Zedan, 2014-05-12 Distributed Computer Systems Theory and Practice is a collection of papers dealing with the design and implementation of operating

Lucid is a new dataflow language designed to exploit the capabilities of the multi processor machines which are more powerful than single processor machines and require a language in which highly parallel algorithms can be easily expressed. The primary objective of this book is to prove that dataflow is a real alternative to sequential imperative computing and that dataflow algorithms can be expressed naturally and concisely in Lucid.

**FORTRAN Optimization** Michael Metcalf, 1985

FORTRAN has always been intended to be an efficient high level language and its adherence to this original design aim has helped it to achieve a dominant position in scientific engineering and other areas of computing. However, advice on how to obtain the best possible performance has until now been scattered through the literature in brief articles, detailed reports on specific computers and very general and often superficial chapters in books on FORTRAN programming. This book for the first time deals with the whole topic in a systematic fashion and every effort has been taken to include only the most up to date information and to present it in a way which clearly distinguishes between the different techniques required for the various types of compiler. The book begins with an extensive introduction to the subject including a justification for optimizing explanations of the hardware of modern computers and the optimizing techniques used by FORTRAN 77 compilers. The preparatory work required before optimizing begins is covered followed by a detailed discussion of the procedures which may be applied to source code to achieve the highest efficiency of execution according to the type of compiler used. IBM and CDC compilers are covered in detail. Program portability is discussed and the use of super computers introduced. The plans for future FORTRAN are presented. A widely used layout program appears in an appendix.

FROM THE PREFACE

Throughout its more than two decades of history one of FORTRAN's main strengths as a programming language has been its adherence to its original design aim of providing efficient program execution. However, advice on how to obtain the best possible performance has hitherto been scattered, being contained either in reports on specific computers and compilers e.g. Smith et al 1977 or in parts of various books of rather too general a nature. This book brings together for the first time a detailed survey of the means by which FORTRAN source code may be optimized and includes other background information which should enable the reader to understand better how a FORTRAN program is processed by a compiler and subsequently executed. As such it is intended to help all those who write or run FORTRAN programs to make efficient use of computer resources without making unjustifiably great demands on their own time. This book should be useful as a reference work for anyone engaged in FORTRAN programming on any scale greater than simple single shot short jobs and as a supplementary text in any course on FORTRAN programming beyond the preliminary stages.
