Smirnov, 2012-12-06 The history of applications of space group theory to solid state physics goes back more than five decades The periodicity of the lattice and the definition of a k space were the corner stones of this application Prof Volker Heine in

Vol 35 of Solid State Physics 1980 noted that even in perfect crystals where k space methods are appropriate the local properties such as the charge density bond order etc are defined by the local environment of one atom Naturally k space methods are not appropriate for crystals with point defects surfaces and interfaces or for amorphous materials In such cases the real space approach favored by chemists to describe molecules has turned out to be very useful To span the gulf between the k space and real space methods it is helpful to recall that atoms in crystalline solids possess a site symmetry defined by the symmetry of the local environment of the atom occupying the site The site symmetry concept is familiar to crystallographers and commonly used by them in the description of crystalline structures However in the application of group theory to solid state physics problems the site symmetry approach has been used only for the last ten to fifteen years In our book *Methods of Group Theory in the Quantum Chemistry of Solids* published in Russian in 1987 by Leningrad University Press we gave the first results of this application to the theory of electronic structure of crystals
