Universal Artificial Intelligence Marcus Hutter, 2005-12-29 Personal motivation The dream of creating artificial devices that reach or outperform human intelligence is an old one It is also one of the dreams of my youth which have never left me What makes this challenge so interesting A solution would have enormous implications on our society and there are reasons to believe that the AI problem can be solved in my expected lifetime So it's worth sticking to it for a lifetime even if it takes 30 years or so to reap the benefits The AI problem The science of artificial intelligence AI may be defined as the construction of intelligent systems and their analysis A natural definition of a system is anything that has an input and an output stream Intelligence is more complicated It can have many faces like creativity solving problems pattern recognition classification learning induction deduction building analogies optimization surviving in an environment language processing and knowledge A formal definition incorporating every aspect of intelligence however seems difficult Most if not all known facets of intelligence can be formulated as goal driven or more precisely as maximizing some utility function It is therefore sufficient to study goal driven AI e.g. the biological goal of animals and humans is to survive and spread The goal of AI systems should be to be useful to humans

An Introduction to Universal Artificial Intelligence Marcus Hutter, David Quarel, Elliot Catt, 2024-05-28 An Introduction to Universal Artificial Intelligence provides the formal underpinning of what it means for an agent to act intelligently in an unknown environment First presented in *Universal Algorithmic Intelligence* Hutter 2000 UAI offers a framework in which virtually all AI problems can be formulated and a theory of how to solve them UAI unifies ideas from sequential decision theory Bayesian inference and algorithmic information theory to construct AIXI an optimal reinforcement learning agent that learns to act optimally in unknown environments AIXI is the theoretical gold standard for intelligent behavior The book covers both the theoretical and practical aspects of UAI Bayesian updating can be done efficiently with context tree weighting and planning can be approximated by sampling with Monte Carlo tree search It provides algorithms for the reader to implement and experimental results to compare against These algorithms are used to approximate AIXI The book ends with a philosophical discussion of Artificial General Intelligence Can super intelligent agents even be constructed Is it inevitable that they will be constructed and what are the potential consequences This text is suitable for late undergraduate students It provides an extensive chapter to fill in the required mathematics probability information and computability theory background You can also visit the author website <http://www.hutter1.net/ai/uaibook2.htm>

construction of intelligent systems and their analysis A natural definition of a system is anything that has an input and an output stream Intelligence is more complicated It can have many faces like creativity solving problems pattern recognition classification learning induction deduction building analogies optimization surviving in an environment language processing and knowledge A formal definition incorporating every aspect of intelligence however seems difficult Most if not all known facets of intelligence can be formulated as goal driven or more precisely as maximizing some utility function It is therefore sufficient to study goal driven AI e.g. the biological goal of animals and humans is to survive and spread The goal of AI systems should be to be useful to humans

Universal Artificial Intelligence Pallavi Mishra,2016 The fields of artificial intelligence has struggled since its inception

about fundamental question of what intelligence means and how to measure it The underlying issue of defining intelligence and its formal measure are sensitive issues in human culture both in respect to humans and more so in respect to machines Several attempts have been made to generalize the definition of universal intelligence and derive formal benchmark tests from such definitions In this thesis we will review the definition of universal intelligence and attempt to aggregate the salient features of mathematically formalized tests proposed for the same The combined theoretical features for benchmark will then be used to analyze one promising platform the Arcade Learning Environment ALE that integrates Atari 2600 games to test domain independent artificial agents We will suggest practical ways to incorporate these features into the ALE platform to manage limitations of computing resources used to generate required environments for agents The limitation of resources is not only a practical constraint but also a factor that should be included in defining any practically useful measure of intelligence We learn from the exercise that defining intelligence by generalizing it is a self defeating goal and that intelligence is best defined with respect to the physical time and computing resource related constraint in which the agent operates An agent with unlimited resources can adapt to infinite set of environments but there can be no practical implementation of such an agent Since physical universe itself has limited although large set of information encoded in the environment with a possibly finite set of non repeating states in order to be of practical use the benchmarks tests should account for physical resources as well as physical time This constraint related view calls for context specific measure of intelligence rather than a cumulative total reward based measure across a defined set of environments

Machine Learning, ECML- ... ,2004 **Artificial Intelligence** William Robert Arnold,John S. Bowie,1986 **Universal Artificial Intelligence** Mitchell Kwok,2006-08 The second half of the computer codes to the Universal Artificial Intelligence program is covered in this book Subject matters such as the follow pathway the retraining of templates and the different search methods are discussed In the previous two books a summary of the UAI is covered but there are missing components This book covers the detailed version of the UAI and all the complicated modules that make up the software The author tries to explain the program to the readers in a simple and straight forward way without the complicated jargons of computer science The book also has a section on discarded chapters the author plans to throw away Because they contain important ideas and suggestions the author wanted to share them with readers The subject matters within these discarded chapters range from topics covered in both the Human Level Artificial Intelligence program and the Universal Artificial Intelligence program
