The Human Population:

The Human Population Charles F. Gritzner, 2009 How many is too many In regard to the human population people have been asking this question for centuries The current world population is approaching seven billion people At the current 1.2 per cent rate of annual increase the population will reach a whopping 9.5 billion people by 2050 The Human Population explores whether this statistical information is cause for alarm examining the issues of feeding such a population sustaining natural resources having enough living space and other necessities for a comfortable life on Earth Is the world suffering from a terrible population explosion or is life getting better for most people despite a growing population These are some of the questions and issues covered in the pages of this fascinating timely new book The Human Population, 1974 The growth rate of the populations of the industrialized nations is approaching zero as both birth and death rates decline Accompanying this transition has been as radical change in the nature of the family and of the role of women These changes constitute a kind of biological revolution a consequence of that other revolution the industrial In the underdeveloped countries zero population growth seems an almost impossible goal Some underdeveloped countries have population doubling times of less than 25 years owing to an improved medical technology that is reducing death rates while having little effect on fertility Still there are reasons to believe that this explosive growth an anomaly in the history of our species is only an early stage in the transition to an industrial economy a higher material standard of living and eventually a much lower rate of population growth Whatever happens it seems certain that before zero growth is attained the world's population will have at least doubled eight billion human beings is a conservative estimate of the total Zero or near zero growth will come but the important questions are when and how The speed with which the industrial revolution comes to the underdeveloped countries will determine whether growth will be stemmed by a high death rate starvation or by a low birth rate This collection of articles from Scientific American gives a comprehensive view of the demographic problems facing humanity today Abundantly illustrated and clearly written The Human Population is essential supplementary reading for all courses dealing with these problems

Human Population Genetic Research in Developing Countries Yue Wang, 2013-11-12 Human population genetic research HPGR seeks to identify the diversity and variation of the human genome and how human group and individual genetic diversity has developed This book asks whether developing countries are well prepared for the ethical and legal conduct of human population genetic research with specific regard to vulnerable target group protection The book highlights particular issues raised by genetic research on populations as a whole such as the potential harm specific groups may suffer in genetic research and the capacity for current frameworks of Western developed countries to provide adequate protections for these target populations Using The People's Republic of China as a key example Yue Wang argues that since the target groups of HPGR are almost always from isolated and rural areas of developing countries the ethical and legal frameworks for human subject protection need to be reconsidered in order to eliminate or at least reduce

the vulnerability of those groups While most discussion in this field focuses on the impact of genetic research on individuals this book breaks new ground in exploring how the interests of target groups are also seriously implicated in genetic work In evaluating current regulations concerning prevention of harm to vulnerable groups the book also puts forward an alternative model for group protection in the context of human population genetic research in developing countries The book will be of great interest to students and academics of medical law ethics and the implications of genetic research

A History of Human Population Control Paul F. Kisak, 2015-12-14 Human population control is the practice of artificially altering the rate of growth of a human population Historically human population control has been implemented with the goal of increasing the rate of population growth In the period from the 1950s to the 1980s concerns about global population growth and its effects on poverty environmental degradation and political stability led to efforts to reduce population growth rates While population control can involve measures that improve people s lives by giving them greater control of their reproduction a few programs most notably the Chinese government s one child policy have resorted to coercive measures This book discusses the various methods and impacts of human population control

The Future Population of the World Wolfgang Lutz, 2013-11-05 The highly acclaimed *The Future Population of the World* contains the most authoritative assessment available of the extent to which population is likely to grow over the next 50 to 100 years The book provides a thorough analysis of all the components of population change and translates these factors into a series of projections for the population of the world s regions This revised and updated version incorporates completely new scenario projections based on updating starting values and revised assumptions plus several methodological improvements It also contains the best currently available information on global trends in AIDS mortality and the first ever fully probabilistic world population projections The projections given up to 2100 add important additional features to those of the UN and the World Bank they show the impacts of alternative assumptions for all three components mortality and migration as well as fertility

they explicitly take into account possible environmental limits to growth and for the first time they define confidence levels for global populations Combining methodological innovation with overviews of the most recent data and literature this updated edition of *The Future Population of the World* is sure to conform its reputation as the most comprehensive and essential publication in the field *Human population*, 1975 [Friedland/Relyea Environmental Science for AP*](#) Andrew Friedland, Rick Relyea, David Courard-Hauri, 2011-02-15 Friedland Relyea Environmental Science for AP was specifically developed to meet the requirements of the AP Environmental Science course and the needs of its students and teachers This highly anticipated new textbook explores the science behind environmental science and involves students with the fundamental concepts and findings that inform environmental decision making at all levels from personal choices to national and international policy This site will be the source for periodic updates on this exciting project as it draws closer to publication For the latest developments or if you would like to be a part of this project as a reviewer or class tester please contact Carlise Stemberge

Estimation of Carrying Capacity for Human Populations in a Part of the Transamazon Highway Colonization Area of Brasil Philip Martin Fearnside, 1978 *Too Many Humans* Morrison Bonpasse, 2015-04-19 This Little Green Book presents 21 proposals for reducing the size of the human population to 1 billion people in order to enable humanity to live sustainably on Earth For centuries and millennia humans have exploited the inherited riches of the Earth without significant observable permanent harm The Industrial Revolution which used non human non animal power sources to accomplish tasks began in the 18th century in Europe and North America In the early 19th century that power increasingly came from the burning of fossil fuels primarily coal and oil and that burning created carbon dioxide The ills of fossil fuel burning were compounded by population growth Around the beginning of the 19th century medical and nutritional advances led to the reduction of the death rate and populations began to grow more rapidly This change can be said to be the beginning of the Demographic Transition which is defined as the period during which there is a large gap between the declining death rate and the subsequent reduction of the birth rate which typically occurs several generations later Proposed here are additional stages of the model to show a Sustainable Demographic Transition SDT to a human population of 1 billion which was the population of the Earth around 1800 The question posed in this book is whether the human birth rate can be reduced soon enough to avoid much of the potential further damage to the Earth and reduced further to enable remediation of previous damage The year 1800 is chosen in this book as the pivotal year for the Industrial Revolution and Demographic Transition At that time the carbon dioxide density in the atmosphere was approximately 300 parts per million During the subsequent 215 years the Industrial Revolution accelerated and together with exponential population growth has degraded the ability of the Earth to sustain life Whatever damage to the Earth the Industrial Revolution would have produced for a planet supporting one billion humans that damage has been multiplied so far by the growth of the human population since 1800 to 7.3 billion by mid 2015 If not stopped the multiplier will continue to grow Even

at the current and seemingly slow annual growth rate of 1.2% the Earth's population will double to 14.6 billion in 58 years. Such a total is inconceivable and avoidable. There has been debate about whether the sheer number of people is the problem or whether their unequal or excessive consumption patterns are the problem. The problem with that debate is that it poses a false choice which need not be resolved here. That is, while there is no question that there is substantial inequality among people of income and wealth and therefore of Earth-degrading consumption, there is also no question that every human being has an impact on the Earth. Putting it simply, more humans produce more carbon. Further, more humans have produced too many more humans. There are two basic elements of each human's impact on the Earth: first, she consumes energy and resources, and second, she has the capacity to have children. Whatever the world's consumption patterns, there will be less consumption and Earth degradation when there are fewer people. This truth is a corollary to the message of population stabilization advocates since the 1970s. Whatever your cause, it's a lost cause until we control population growth. The first of the 21 proposals is that all humans be encouraged to have no children or at most one child. The alternative to achieving population reduction through voluntary means is to endure catastrophes and collapse and gross reduction of biodiversity.
