

Archimedes had to do was measure the crown in water and determine how much water it displaced. That would tell him how much space the crown occupied. Archimedes was so excited by this discovery that he ran through the streets screaming “Eureka,” which means “I have found it.” There was one embarrassing little problem, however. Archimedes was so excited by his discovery that he forgot to put any clothes on! In other words, he ran through the streets completely naked! While Archimedes himself never wrote of this incident (I would think he was too embarrassed), the story was reported by a Roman writer named Vitruvius about 200 years after it was supposed to have happened.

uh hell I think there may be an official academic term for this :)

The last Greek scientist I want to discuss lived about 100 years after Christ’s birth. His name was Ptolemy (uh, miss), and he studied the heavens. He was one of the first to attempt a complete description of the planets and stars. He assumed that the earth was at the center of the universe, and that the planets and stars orbited about the earth in a series of circles.

At the time, Ptolemy could explain a lot of the astronomical data that had been collected using his idea, so it became very popular. Sometimes, his view of the stars and planets is referred to as the **Ptolemaic system**, in an attempt to honor him. Sometimes, it is referred to as the **geocentric system**, to emphasize the fact that Ptolemy thought the earth was at the center of the universe.

The geocentric system was considered the correct explanation for the arrangement of planets and stars in space until about the 1700s. Then, it was a popular theory for nearly 1,600 years. Once again, however, the reason the geocentric system was so popular had less to do with the scientific evidence and more to do with other considerations. Like Aristotle, Ptolemy was (rightly) considered a

great scientist. As data were collected that contradicted the geocentric system, many scientists ignored the data out of reverence for Ptolemy.

There was actually another, probably more important reason the geocentric system became so popular: It fit many scientists’ preconceived notions of how things ought to be. In the geocentric system, the earth was at the center of the universe and everything revolved around it. Since most people believed that the earth was the most important part of the universe, the geocentric system “made sense.”

Sadly, some of the most ardent support for the geocentric system came from the Roman Catholic Church. As more and more scientific evidence came pouring in indicating wrong ideas in the geocentric system, the church tried to resist any movement away from it. After all, the church reasoned, since God created man, the earth must be the most important thing in the universe, so it must be at the very center, and everything else must travel around it, just as Ptolemy said. Now, of course, somewhere in the Bible is such a thing written, but that didn’t stop the church from believing in it!

been almost as if ppl like this author continue to feed this exact stereotype today

In the end, it took hundreds of years of scientific data (and a few people being thrown out of the Roman Catholic Church) before the church was convinced to give up on the geocentric system. Unfortunately, for that time, the damage had been done. The church became viewed as antagonistic towards science, and worse people today still hold that view. This is unfortunate because, as you will see in later sections of this module, Christianity is a friend to science. Most of the great scientists in history were Christians, and their Christianity is often credited for their scientific achievements. Nevertheless, because the Roman Catholic Church was unwilling to give up on the geocentric system when the scientific evidence was overwhelming, many still see Christianity as an enemy of science. That’s a real bummer.

entire paragraph here is an incredible feat of cognitive distortion

So this little episode from history shows us another way that science should not be done. You should not hold fast to an idea simply because it fits with your preconceived notions. Science is built on data, not a person’s beliefs. The acceptance or rejection of a scientific proposition, then, should rest solely on the data, nothing more. Today, there is an idea called **evolution**. It is popular among scientists not because there is a lot of evidence for it, but because it fits many scientists’ preconceived notions. As you will learn in a later module, very little evidence exists for the idea of evolution, and significant evidence exists against it. Nevertheless, it is still a prevalent idea because many people like the fact that it tries to explain the existence of life without ever referring to God. As a result, they believe the idea in spite of the evidence. Unfortunately, these people have not learned from the history of science. The history of science teaches us over and over again that believing in an idea because of preconceived notions hurts the cause of science; it does not help it!

ON YOUR OWN

1.4 Dr. Steven Hawking is one of the most brilliant scientists of the decade. He believes in an idea called “the big bang.” This idea tries to describe how the universe was formed. If your friend tells you that you should believe in the big bang because Dr. Hawking is smart and he believes in it, what famous example from the history of science should you tell to your friend?

1.3 What episode from the history of science tells us we need to leave our personal biases behind when we do science?
