Unit Processes in Organic Synthesis ... Fourth Edition Philip Herkimer GROGGINS, 1952 **Mono-Olefins** F.

Asinger, 2013-10-22 *Mono Olefins Chemistry and Technology* is a translation from the German and deals with the study of olefins from low ethylene to hexenes and olefins from the high hexenes to eicosenes. The book describes the gaseous or low boiling olefins and the higher normally liquid olefins which have only a minor role in applications in the chemical industry. The olefins are considered important as they are added in the distillation of off-gases in refineries. Although the liquid olefins are used sparingly, these are needed to manufacture lubricants, synthetic detergents, and the higher aliphatic alcohols. The book then explains the three processes used to separate olefin-containing mixtures of gases into fractions by the C number or to convert olefins in the pure state: distillation, absorption, and adsorption. The author then describes the processes in manufacturing carburetor fuel from petroleum and natural gases. Petroleum oil is a mixture of paraffinic, naphthenic, and aromatic hydrocarbons and has no olefins. The text describes the complete process of refining petroleum into different products such as gasoline, kerosene, lubricants, and spotting benzenes. Then the book explains the polymerization of olefins to produce carburetor fuels either by the thermal method or catalytic method. The text notes some research made into double bond isomerization in mono olefins and their possible applications. This book is beneficial to industrial chemists, researchers, technical designers, and engineers whose works are related with oil refinery and fossil fuels.

Unit processes in organic synthesis P. H. Groggins, 1958 *Unit Processes in Organic Chemical Industries*, 1982 **A Textbook of Organic Chemistry, 4th Edition** Tewari, K.S. & Vishnoi, N.K., The book *A Textbook of Organic Chemistry* was first published 40 years ago. Over the years it has become students' favourite because it explains the subject in the most student-friendly way and is revised regularly to keep itself updated with the latest in research. This edition presents the modern-day basic principles and concepts of the subject as per the CBCS of UGC guidelines. Special emphasis has been laid on the mechanism and electronic interpretation of reactions of the various classes of compounds. It provides a basic foundation of the subject so that based on these students are able to extrapolate, predict, and solve challenging problems. New in this Edition: A new chapter *Energy in Biosystems* explores the fundamentals of biochemical reactions involved in storage as well as continuous usage of energy in biosystems. Structural theories like VB and MO hybridization and orbital pictures of resonance and hyperconjugation, Woodward-Fieser rules for calculating max and Norrisch type I and II reactions of special photochemical C-C cleavage in the chapter on Electromagnetic Spectrum, Polanyi-Hammond postulates, and Curtin-Hammett principle, along with several new mechanisms e.g. Favorskii, Baeyer-Villiger, and Birch in Chapter 5, McMurry, Wittig, Stobbe, Darzen in Chapter
