Time Constrained Memory A Reader Based Approach To Text Comprehension:

Time-constrained Memory Jean-Pierre Corriveau, 1995

Time-constrained Memory Jean-Pierre

Corriveau, 2014-02-04 This book tries to answer the question posed by Minsky at the beginning of *The Society of Mind* to explain the mind we have to show how minds are built from mindless stuff from parts that are much smaller and simpler than anything we'd considered smart. The author believes that cognition should not be rooted in innate rules and primitives but rather grounded in human memory. More specifically, he suggests viewing linguistic comprehension as a time-constrained process: a race for building an interpretation in short-term memory. After reviewing existing psychological and computational approaches to text understanding and concluding that they generally rely on self-validating primitives, the author abandons this objectivist and normative approach to meaning and develops a set of requirements for a grounded cognitive architecture. He then goes on to explain how this architecture must avoid all epistemological commitments, be tractable both with respect to space and time, and most importantly, account for the diachronic and non-deterministic nature of comprehension. In other words, a text may or may not lead to an interpretation for a specific reader and may be associated with several interpretations over time by one reader. Throughout the remainder of the book, the author demonstrates that rules for all major facets of comprehension—syntax, reference, resolution, quantification, lexical and structural disambiguation, inference, and subject matter—can be expressed in terms of the simple mechanistic computing elements of a massively parallel network modeling memory. These elements, called knowledge units, work in a limited amount of time and have the ability not only to recognize but also to build the structures that make up an interpretation. Designed as a main text for graduate courses, this volume is essential to the fields of cognitive science, artificial intelligence, memory modeling, text understanding, computational linguistics, and natural language understanding. Other areas of application are schema matching, hermeneutics, local connectionism, and text linguistics. With its extensive bibliography, the book is also valuable as supplemental reading for introductory undergraduate courses in cognitive science and computational linguistics.

Text, Speech and Dialogue Petr Sojka, Aleš Horák, Ivan

Kopeček, 2008-09-09 The annual Text, Speech and Dialogue Conference (TSD), which originated in 1998, is now starting its second decade. So far, almost 900 authors from 45 countries have contributed to the proceedings. TSD constitutes a recognized platform for the presentation and discussion of state-of-the-art technology and recent achievements in the field of natural language processing. It has become an interdisciplinary forum interweaving the themes of speech technology and language processing. The conference attracts researchers not only from Central and Eastern Europe but also from other parts of the world. Indeed, one of its goals has always been to bring together NLP researchers with different interests from different parts of the world and to promote their mutual cooperation. One of the ambitions of the conference is, as its title says, not only to deal with dialogue systems as such but also to contribute to improving dialogue between researchers in the two areas of NLP, i.e., between text and speech people. In our view, the TSD conference was successful in this respect in 2008 as well. This volume

contains the proceedings of the 11th TSD conference held in Brno Czech Republic in September 2008 Following the review process 79 papers were accepted out of 173 submitted an acceptance rate of 45.7% Proceedings of the Eighteenth Annual Conference of the Cognitive Science Society Cognitive Science Society (U.S.).
