

Theoretical Probability

The theoretical probability of an event occurring is

$$\text{Theoretical probability} = \frac{\text{frequency of the event occurring}}{\text{total frequency of possible outcomes}}$$

Mutually exclusive events cannot happen at the same time.

For example, a fair die cannot land on a 3 and a 4 at the same time and a coin flip cannot land on heads and tails at the same time.

If an object (a coin, spinner, or dice for example) is described as **fair**, or **unbiased**, the theoretical probability of each outcome is the same; the theoretical probability of flipping a tails on a fair coin is $\frac{1}{2}$, the theoretical probability of rolling a 2 on a fair 6-sided dice is $\frac{1}{6}$.

Theoretical Statistics Robert W. Keener, 2010-09-08 Intended as the text for a sequence of advanced courses this book covers major topics in theoretical statistics in a concise and rigorous fashion The discussion assumes a background in advanced calculus linear algebra probability and some analysis and topology Measure theory is used but the notation and basic results needed are presented in an initial chapter on probability so prior knowledge of these topics is not essential The presentation is designed to expose students to as many of the central ideas and topics in the discipline as possible balancing various approaches to inference as well as exact numerical and large sample methods Moving beyond more standard material the book includes chapters introducing bootstrap methods nonparametric regression equivariant estimation empirical Bayes and sequential design and analysis The book has a rich collection of exercises Several of them illustrate how the theory developed in the book may be used in various applications Solutions to many of the exercises are included in an appendix
