Tectonic Geomorphology:

Tectonic Geomorphology Douglas W. Burbank, Robert S. Anderson, 2011-11-02 Tectonic geomorphology is the study of the interplay between tectonic and surface processes that shape the landscape in regions of active deformation and at time scales ranging from days to millions of years Over the past decade recent advances in the quantification of both rates and the physical basis of tectonic and surface processes have underpinned an explosion of new research in the field of tectonic geomorphology Modern tectonic geomorphology is an exceptionally integrative field that utilizes techniques and data derived from studies of geomorphology seismology geochronology structure geodesy stratigraphy meteorology and Quaternary science While integrating new insights and highlighting controversies from the ten years of research since the 1st edition this 2nd edition of Tectonic Geomorphology reviews the fundamentals of the subject including the nature of faulting and folding the creation and use of geomorphic markers for tracing deformation chronological techniques that are used to date events and quantify rates geodetic techniques for defining recent deformation and paleoseismologic approaches to calibrate past deformation Overall this book focuses on the current understanding of the dynamic interplay between surface processes and active tectonics As it ranges from the timescales of individual earthquakes to the growth and decay of mountain belts this book provides a timely synthesis of modern research for upper level undergraduate and graduate earth science students and for practicing geologists Additional resources for this book can be found at www.wiley.com/go/burbankgeomorphology

Tectonic Geomorphology of Mountains William B. Bull, 2008-04-15 With a balance of theory and practical applications Tectonic Geomorphology of Mountains is essential reading for research geologists and upper level undergraduate and graduate students in the earth sciences This book describes how tectonic events influence geomorphic processes and explores how landscapes respond to tectonic deformation in the ways in which they are weathered washed and abraded Uses new approaches to enhance theoretical models of landscape evolution and to solve practical problems such as the assessment of earthquake hazards Includes previously unpublished research and theory Examines how to use key landforms as reference levels in changing landscapes estimate rates of mountain range uplift and map seismic shaking caused by prehistorical earthquakes Presents a diverse range of examples from around the world *Tectonic Geomorphology* Douglas W.

Tectonic Geomorphology Douglas W. Burbank, Robert S. Anderson, 2009-05-06 Tectonic geomorphology is the study of the interplay between tectonic and surface processes that shape the landscape in regions of active deformation Recent advances in the quantification of rates and physical basis of tectonic and surface processes have rejuvenated the field of tectonic geomorphology Modern tectonic geomorphology is an exciting and highly integrative field which utilizes techniques and data derived from studies of geomorphology seismology geochronology structure geodesy and Quaternary climate change While emphasizing new insights from the last decade of research Tectonic Geomorphology reviews the fundamentals of the subject which include the nature of faulting and folding the creation and use of geomorphic markers for tracing deformation chronological techniques which date deformation geodetic techniques for defining recent deformation and paleoseismologic approaches to calibrate past deformation The overall focus of this book is on new interpretations of landform evolution and insights on the interplay between surface processes and tectonics that emerge from integrative studies The authors have developed an up to date interpretation of landscapes in tectonically active environments for upper level undergraduate and graduate earth science students and practicing geologists For an instructor's image bank please visit <http://www.geol.ucsb.edu/faculty/burbank> First text to take a broad interdisciplinary approach integrated geomorphology geophysics and paleoclimatology Includes the latest technological advances used in dating Uranium series and dating and observation Emphasizes the role of surface processes Focuses on landscapes at different time scales Provides strong coverage on numerical modeling of tectonically active landscapes Presents the recent approaches to calibrating rates of uplift and erosion Stresses the tectonics of active plate margins in a detailed yet succinct way Contains Chapter introductions Chapter summaries and References that reinforce principles and theory as well as provide additional background information

Tectonic Geomorphology Navodita Bhatnagar, 2016-11-30 Tectonic geomorphology is the study of the interplay between tectonic and surface processes that shape the landscape in regions of active deformation and at time scales ranging from days to millions of years This book focuses on the current understanding of the dynamic interplay between surface processes and active tectonics [Active Tectonics](#) National Research Council, Division on Engineering and Physical Sciences, Commission on Physical Sciences, Mathematics, and Applications, Geophysics Research Forum, Geophysics Study

Committee,1986-01-01 Over 250 000 people were killed in the Tangshan China earthquake of 1976 and other less active tectonic processes can disrupt river channels or have a grave impact on repositories of radioactive wastes Since tectonic processes can be critical to many human activities the Geophysics Study Committee Panel on Active Tectonics has presented an evaluation of the current state of knowledge about tectonic events which include not only earthquakes but volcanic eruptions and similar events This book addresses three main topics the tectonic processes and their rates methods of identifying and evaluating active tectonics and the effects of active tectonics on society

Encyclopedia of Geomorphology Andrew Goudie,2004 The first such reference work in thirty five years this is a comprehensive guide to both specific landforms and the major types of processes that create them This two volume set provides a historical overview of the field while exploring recent key discoveries about tectonic and climatic changes as well as the use of new techniques such as modeling remote sensing and process measurement Written by a team of expert contributors from over thirty countries the nearly 700 alphabetically arranged entries are cross referenced indexed and include up to date suggestions for further reading Fully illustrated with over 360 tables and illustrations this will be the definitive reference source for students researchers and practitioners in geomorphology as well as geography earth science sedimentology and environmental science

Treatise on Geomorphology ,2013-02-27 The changing focus and approach of geomorphic research suggests that the time is opportune for a summary of the state of discipline The number of peer reviewed papers published in geomorphic journals has grown steadily for more than two decades and more importantly the diversity of authors with respect to geographic location and disciplinary background geography geology ecology civil engineering computer science geographic information science and others has expanded dramatically As more good minds are drawn to geomorphology and the breadth of the peer reviewed literature grows an effective summary of contemporary geomorphic knowledge becomes increasingly difficult The fourteen volumes of this Treatise on Geomorphology will provide an important reference for users from undergraduate students looking for term paper topics to graduate students starting a literature review for their thesis work and professionals seeking a concise summary of a particular topic Information on the historical development of diverse topics within geomorphology provides context for ongoing research discussion of research strategies equipment and field methods laboratory experiments and numerical simulations reflect the multiple approaches to understanding Earth s surfaces and summaries of outstanding research questions highlight future challenges and suggest productive new avenues for research Our future ability to adapt to geomorphic changes in the critical zone very much hinges upon how well landform scientists comprehend the dynamics of Earth s diverse surfaces This Treatise on Geomorphology provides a useful synthesis of the state of the discipline as well as highlighting productive research directions that Educators and students researchers will find useful Geomorphology has advanced greatly in the last 10 years to become a very interdisciplinary field Undergraduate students looking for term paper topics to graduate students starting a literature review for their thesis work

and professionals seeking a concise summary of a particular topic will find the answers they need in this broad reference work which has been designed and written to accommodate their diverse backgrounds and levels of understanding Editor in Chief Prof J F Shroder of the University of Nebraska at Omaha is past president of the QG G section of the Geological Society of America and present Trustee of the GSA Foundation while being well respected in the geomorphology research community and having won numerous awards in the field A host of noted international geomorphologists have contributed state of the art chapters to the work Readers can be guaranteed that every chapter in this extensive work has been critically reviewed for consistency and accuracy by the World expert Volume Editors and by the Editor in Chief himself No other reference work exists in the area of Geomorphology that offers the breadth and depth of information contained in this 14 volume masterpiece From the foundations and history of geomorphology through to geomorphological innovations and computer modelling and the past and future states of landform science no stone has been left unturned *Tectonic Geomorphology* Wolfgang

Willett,2006-01-01 The Liwu River runs a short course its channel head at the water divide in Taiwan s Central Range is a mere 35 km from its outflow into the Pacific Ocean But in those short 35 km the Liwu has carved one of the world s geographic wonders the spectacular Taroko Gorge with marble and granite walls soaring nearly 1000 m above the river channel Taroko Gorge was a fitting venue for a 2003 Penrose Conference that addressed the coupled processes of tectonics climate and landscape evolution The young mountains extreme weather and dramatic landforms provided an appropriate backdrop to wide ranging discussions of geomorphic processes climate and meteorology sediment generation and transport the effects of erosion on tectonics and new analytical and modeling tools used to address these processes and problems This volume s papers extend that discussion reaching across fields that have experienced rapid advances in the past decade Publisher s website **Geomorphology and Global Tectonics** Michael A. Summerfield,2000-04-07 Presents the state of current research on the inter relationships between global tectonics and macroscale landscape development across a wide range of topics and study areas The last 10 years have witnessed a remarkable growth in interest in the relationships between global tectonics and the Earth s maroscale topographic features This new research emphasis has emerged from a range of practitioners within the earth sciences including geophysicists concerned with what can be learnt about tectonic processes from their topographic effects geologists interested in the factors controlling erosion and the supply of material to sedimentary basins and geomorphologists wanting to understand the role of tectonics in landscape evolution Various technical developments and new sources of data have also contributed to these developments such as the construction of coupled tectonic surface process numerical models of large scale landscape development the creation of large area high resolution digital elevation models and the derivation of long term denudational records using methods such as thermochronology This book presents an overview of innovative research in the area and provides directions for future

research Each chapter provides up to date surveys of key research questions reports on important current work and highlights outstanding research issues It will be invaluable to those across the earth science community who are interested in the relationships between tectonics and geography *Tectonic Geomorphology of Mountains* William B.
