Testing Complex and Embedded Systems Kim H. Pries,Jon M. Quigley,2018-09-03 Many enterprises regard system level testing as

the final piece of the development effort rather than as a tool that should be integrated throughout the development process As a consequence test teams often execute critical test plans just before product launch resulting in much of the corrective work being performed in a rush and at the last minute Presenting combinatorial approaches for improving test coverage Testing Complex and Embedded Systems details techniques to help you streamline testing and identify problems before they occur including turbocharged testing using Six Sigma and exploratory testing methods Rather than present the continuum of testing for particular products or design attributes the text focuses on boundary conditions Examining systems and software testing it explains how to use simulation and emulation to complement testing Details how to manage multiple test hardware and software deliveries Examines the contradictory perspectives of testing including ordered random structured unstructured bench field and repeatable non repeatable Covers essential planning activities prior to testing how to scope the work and how to reach a successful conclusion Explains how to determine when testing is complete Where you find organizations that are successful at product development you are likely to find groups that practice disciplined strategic and thorough testing Tapping into the authors decades of experience managing test groups in the automotive industry this book provides the understanding to help ensure your organization joins the likes of these groups

Supervised Testing of Embedded Concurrent Software Jasmin Jahic,2021-04-13 Scientists and practitioners have developed approaches for testing sequential software However there is a gap in the current state of the art regarding the understanding and formulation of a general approach for testing concurrent software especially in domains that limit concurrency such as the domain of embedded software systems Consequently testing approaches fail to separate faulty and correct behavior of such software leading to many false warnings Besides as there exist no appropriate code coverage criteria for concurrent software existing approaches can miss some concurrency faults This dissertation presents a generalized model of an approach for finding concurrency bugs based on a systematic literature review By comparing the generalized model and architectural drivers in embedded systems this work identifies key reasons why the existing approaches report too many false warnings when testing embedded concurrent software For these challenges this work offers solutions in terms of enhancements to i the existing analysis algorithms ii the execution tracing techniques and iii coverage of concurrent software interleavings

Software Engineering for Embedded Systems Mark Pitchford,2013-04-01 State of the art techniques and best practices in the development of embedded software apply not only to high integrity devices such as those for safety critical applications like aircraft flight controllers car braking systems or medical devices but also to lesser integrity applications when the need to optimize the effectiveness of the available test time and budget demands that pragmatic decisions should

be made To complement this multitude of software test techniques there is a similar plethora of test tools available to automate them These tools are commonplace in the development of safety critical applications but elsewhere not everyone has the budget to buy all or indeed any of them Of course the providers of these tools would advocate the purchase of each and every one of them so how can a limited budget best be allocated And where no budget exists how can similar principles be applied to provide confidence that the finished item is of adequate quality In addressing these issues not only are the concepts behind the techniques presented but also some case study software code examples to drill a little deeper and illustrate how some of them are implemented in practice

Testing and Security Related Considerations in Embedded Software Luke Pierce,2016 The continued increasing use of microprocessors in embedded systems has caused a proliferation of embedded software in small devices In practice many of these devices are difficult to update to fix security flaws and software errors This brings an emphasis on ensuring the secure and reliable software prior to the release of the device to ensure the optimal user experience With the growing need to enable test and diagnostic capabilities into embedded devices the use of the JTAG interface has grown While the intentions of the interface was originally to give the ability to shift in data into and out of chip s scan chains for test the generic framework has allowed for its features to expand For embedded microprocessor s the interface allows for halting execution insertion of instructions reprogramming the software and reading from memory While it creates a powerful debugging system it also allows unlimited access to a malicious users In turn such a user has the ability to either copy the intellectual property on the device disable digital rights management routines or alter the devices behavior A novel method to secure JTAG access through the use of a multi tiered permission system is presented in this paper The use of static code analysis can be used to verify the functionality of embedded software code Ideally a software code should be tested in a way that guarantees correct behavior across all possible execution paths While in practices this is typically infeasible due to the innumerable number of paths in the system the use of automated test systems can help maximize the amount of code covered In addition such methods can also identify non executable software statements that can be an indication of software issues or sections of software that should not be targeted for testing New static code analysis methods are presented in this dissertation One technique uses supersets of software solution spaces to correctly identify unreachable software code in complex systems Another presented technique automatically generates a set of test vectors to quickly maximize the number of code blocks executed by the set of test vectors It is shown that such a method can be significantly faster than traditional methods

Automated Testing
Nader Kesserwan, 2020 Testing is the most common activity to validate software systems and plays a key role in the software development process In general the software testing phase takes around 40-70% of the effort time and cost This area has been well researched over a long period of time Unfortunately while many researchers have found methods of reducing time and cost during the testing process there are still a number of important related issues such as generating test cases from UCM scenarios and validate them need to be researched As a result ensuring that an embedded software behaves correctly is non trivial especially when testing with limited resources and seeking compliance with safety critical software standard It thus becomes imperative to adopt an approach or methodology based on tools and best engineering practices to improve the testing process This research addresses the problem of testing embedded software with limited resources by the following First a reverse engineering technique is exercised on legacy software tests aims to discover feasible transformation from test layer to test requirement layer The feasibility of transforming the legacy test cases into an abstract model is shown along with a forward engineering process to regenerate the test cases in selected test language Second a new model driven testing technique based on different granularity level MDTGL to generate test cases is introduced The new approach uses models in order to manage the complexity of the system under test SUT Automatic model transformation is applied to automate test case development which is a tedious error prone and recurrent software development task Third the model transformations that automated the development of test cases in the MDTGL methodology are validated in comparison with industrial testing process using embedded software specification To enable the validation a set of timed and functional requirement is introduced Two case studies are run on an embedded system to generate test cases The effectiveness of two testing approaches are determined and contrasted according to the generation of test cases and the correctness of the generated workflow Compared to several techniques our new approach generated useful and effective test cases with much less resources in terms of time and labor work Finally to enhance the applicability of MDTGL the methodology is extended with the creation of a trace model that records traceability links among generated testing artifacts The traceability links often mandated by software development standards enable the support for visualizing traceability model based coverage analysis and result evaluation
