these conditions are also compared Total soil solution concentration estimated by electrical conductivity measurements and  
NA and CA concentrations measured by flame photometry are discused Salt effects on soil water diffusivity were more  
pronounced at larger values of water content Movement of water in Ca saturated samples was significantly affected only  
when the soil solution concentration was smaller than approximately 2 me l Soil samples treated with SAR 5 presented  
reductions in soil water diffusivity when the solution concentration was equal to or smaller than approximately 3 5 me l and  
the water content larger than 0 35 cm<sup>3</sup> cm<sup>3</sup> The soil water diffusivity was also affected when the solution concentration was  
equal to or smaller than approximately 2 me l and the water content larger then 0 30 cm<sup>3</sup> cm<sup>3</sup> Soil water diffusivity of  
samples treated with SAR 15 was affected basically at all values of water content when the soil solution concentration was  
equal to or smaller than approximately 3 5 me l When such concentration was a large as 5 me l reductions in soil water  
diffusivity were apparent only for water contents larger than 0 25 cm<sup>3</sup> cm<sup>3</sup> Chemical analyses of soil solution after  
infiltration revelated that most soluble salts in the soil column were carried near the wetting front Significant displacement  
of Na by Ca occurred in soils treated with SAR 5 and 15 Although Bruce and Klute s method does not apply for chemically  
unstable and swelling soils the slope of the plot of distance to the wetting front versus square root of time fitted the Boltzman  
variable for the water content of wetting front satisfactorily This fact suggests good reliabillity of reported soil water
