Working Time And Employment:

Working Time in the Employment Relationship Lonnie Golden, Susan Lambert, Julia Henly, Barbara Wiens-Tuers, 2011 The consequences of hours of employment for a worker's work life interface depends not only on the number of hours of work but also whether a worker perceives that they have some discretion over the setting and timing of their work hours and schedule. When a worker perceives to lack such discretion this may have at least as much adverse effect on work life balance as working long or extra hours. This research analyzes data from a large nationally representative survey in the US that permit observation of six indicators of employee centered flexibility: discretion or control that may or may not be available to workers. Three types of flexibility include the extent to which the employee sets their own scheduled hours, can vary their daily starting and quitting times of work, and can take time off during the work day. Three types of inflexibility include whether their overtime hours of work are required by their employer, work shift times are irregular, and actual hours of work are longer than their preferred number of hours. Multinomial regression analysis finds that a longer duration of weekly hours, extra days worked per month, and working full time work hours enhances both conflict and fatigue. When controlling for these effects of longer hours, however, having discretion in setting their own work schedule, an ability to vary their own starting and quitting times of work, and to take time off during the work day are all associated with lower work life conflict. Similarly, an inability to refuse overtime work or to realize a preference for part time hours, and working irregular shift times are all associated with greater work family conflict. Having discretion over schedule, ability to take time off during the day, and flexible start and end times are all associated with less daily fatigue among full time workers and salaried workers, however not among hourly paid workers. Having mandatory overtime work is associated with greater frequency of fatigue, but working irregular shift times has no relation to fatigue. The analysis suggests that an employment relationship of the future that features the type of flexibility which permits better integration of work with non work time will promote better daily work life balance. In particular, granting employees more autonomy to set and adjust the timing of their work schedules will help counter the deleterious effects of longer work hours on the daily well being of workers. The implications for collective action through public policy or collective bargaining in countries such as US and Australia are that creating more individualized working time structures and options for more workers would better facilitate daily work life balance.

Working Time Deborah M. Figart, Lonnie Golden, 2013-01-11 Working time is a crucial issue for both research and public policy. This book presents the first comprehensive analysis of both paid and unpaid work time, integrating a unique discussion of overwork, underwork, shortening of the working week, and flexible work practices. Time at work is affected by a complex web of evolving culture and social relations, as well as market, technological, and macroeconomic forces, and institutions such as collective bargaining and government policy. Using a variety of new data sources, the authors review the latest trends on working time in numerous countries.

model specifications and nerve racking convergence problems *Part-Time Work and Employee Satisfaction* Paula Müller, 2018-11-28 Essay from the year 2014 in the subject Leadership and Human Resources Miscellaneous grade 1 0 University of Applied Sciences Dresden language English abstract Is part time work the key to happier families Empirical findings on job satisfaction and personal happiness of part time workers Over the last decades there has been a large increase of women in jobs and hence an increase in dual earner households Consequently a significantly higher amount of stress and pressure on men and women has been observed as it is difficult to combine the duties at work and at home which can reduce the overall quality of life and threat the work life balance For many people part time work can be a solution to this problem especially in industrial nations By definition an employee works part time if he regularly works fewer hours than a comparable full time employee The number of hours varies from state to state and institution to institution However there has been an increase in part time work also in traditionally full time professions In Europe about 32% of all women and 8% of men work part time though this rate is lowest in eastern countries and highest in northern and western countries In the USA about 23% of employees work part time But does part time employment really increase the personal and work satisfaction Why is the satisfaction higher or lower and what are benefits and disadvantages of part time work Moreover what determines the satisfaction in part time arrangements apart from influences of work and personal life
