

STATIC ELECTRICITY

Static Electricity

- Charge that is not passed through circuit when two objects together

Electric Force

- Interaction with matter in object, kg charge how far or not in cloud charge - movement of electrons

As Q goes up, force \rightarrow vs charge, goes more vs charge
 Charge Q : measures how much object will interact with electric/magnetic fields
 charge measured in coulombs (C)

- $1 \text{ C} = 1 \text{ amp} \cdot \text{sec}$
- $1 \text{ C} = 6.25 \times 10^{18}$ electrons

- Protons and electrons have charge of:

$$q_p = 1.602 \times 10^{-19} \text{ C}$$

- conductor material which is easily able to carry electric charge
 insulator material which is unable to carry electric charge
 when charges pass through insulators, they build up (stop moving)

- static electricity involves insulators

Example: hair sticking up

Atoms are neutral, no charge, cancel out when electrons moved on hair, e^- moved off hair and on bathroom surface to insulator, they build up on bathroom

As e^- move into bathroom, gain $-$ vs charge

hair losing e^- , gains $+$ charge

not charged bathroom, vs charged hair

opposites attract

to bathroom and hair move close together

vs bathroom pulled during shower, hair is attracted to it

to attract hair to shower

- in examples:

vs electric force acting on object due to other and

electric force acting on hair due to bathroom

electric force, F , has cause attraction/repulsion between 2 charged objects

size of electrical force depends on charge (q), electrical field, E

$$F = Eq$$

Electric Fields

- Source charges create that creates electric field around it

Source of charge

Electric field area around charged object

area of space where other charged particles are affected

- Creating electric fields

how big electric field is

how it affects charges around

we look to show shape of field

most electric fields are radial (parallel lines)

or radial from charge (center of isolated line)

- Direction of other charges are attracted or repelled

direction they move when affected by electric field

Direction way the charge would move if put into field

in case pointing away

vs surrounding single charge/object

- Strength how close lines are

stronger field, greater ability to attract particles in range

Strength E units: N/C

$$E = \frac{F}{q}$$

Uniform Electric Fields

- Field has same strength everywhere
 charge will be attracted same level in any other place
 - straight, parallel, evenly spaced

- Ex: two metal plates, $+$ and $-$

plates are source charge of electric field between metal plates

force vs charge in uniform field revealed by vs plate, arrow from $+$ to $-$

- voltage:

2 metal plates make charge between plates move

to create field between plates is giving energy to charge in between

voltage when charges gain or lose energy

if energy is lost, gain energy

if energy is vs, losing energy

Electric Potential Energy

- all electrical potential energy
 how much charge wants to move when placed in electric field
 depends on where positioned, how big field is

potential charged plates (electric field is uniform)

symbolizing Q against vs plate

As soon as let go, ends to vs plate

vs electric potential energy was converted into kinetic energy

potential energy of charge (Q) put in electric field (E) at distance (d):

$$\Delta U_p = Eqd$$

kinetic energy energy of movement

- size of electric potential energy on charge in electric field depends on:

charge in electric field, change in potential

no distance between, charge change about where it ends

electric field strength, E

voltage plate gain and put charge, more

size of charge, q

vs bigger charge has electric field more

Velocity

- if no friction, electrical potential energy = kinetic energy

$$\Delta U_p = K_e$$

1. calc electrical potential energy

2. calc kinetic energy

3. calc $E_k = \frac{1}{2}mv^2$ to find velocity

Work

- giving largest electric force vs charge to vs plate

vs energy must be put in

put work, move charge from plate to plate to create vs, transfer more electrical energy

center amount of energy to move charged particle between charges to create vs (potential)

symbolizing

with Coulomb, Q

As particle is moved further from charges attracted to, why Q vs d^2

Millikan Oil Drop

- Robert Millikan noticed that vs particles, size of charge on electron
 vs oil drop between charged plates had surrounding object's
 charged electrons, field to hold oil in place, work drop falling due to gravity,
 when stop and start, force of gravity, electric force
