Sample Handling and Trace Analysis of Pollutants Damia Barcelo, 2000-03-08 This book is an updated completely revised version of a previous volume in this series entitled ENVIRONMENTAL ANALYSIS Techniques applications and quality assurance The book treats different aspects of environmental analysis such as sample handling and analytical techniques the applications to trace analysis of pollutants mainly organic compounds and quality assurance aspects including the use of certified reference materials for the quality control of the whole analytical process New analytical techniques are presented that have been developed significantly over the last 6 years like solid phase microextraction microwave assisted extraction liquid chromatography mass spectrometric methods immunoassays and biosensors The book is divided into four sections The first describes field sampling techniques and sample preparation in environmental matrices water soil sediment and biota The second section covers the application areas which are either based on techniques like the use of gas chromatography atomic emission detection immunoassays or coupled column liquid chromatography or on specific application areas like chlorinated compounds pesticides phenols mycotoxins phytotoxins radionuclides industrial effluents and wastes including mine waste Validation and quality assurance are described in the third section together with the interpretation of environmental data using advanced chemometric techniques The final

section reports the use of somewhat advanced analytical methods usually more expensive less routinely used or less developed for the determination of pollutants Some Aspects of Trace Analysis and Environmental Chemistry A H. Over the last few years we have witnessed increasing efforts dedicated to the scientific investigation and characteristics of trace elements Especially in the field of human and animal nutrition trace elements display a considerably attractive issue for research because they play an essential role in the nutrition of both animals and humans Aquatic environments contaminated with trace elements are an emerging research area due to the toxicity abundance and environmental persistence of trace elements Accumulation of heavy metals as a class of trace elements in various environments and the subsequent transition of these elements into the food and feed chain severely affects human health The determination of type and concentration of trace elements is regarded as the first and most important step to follow the mechanisms controlling the dispersal and accumulation of trace elements Element speciation in different media water soil food plants coal biological matter food and fodder is pivotal to assess an element s toxicity bioavailability environmental mobility and biogeochemical performance Recently new analytical techniques have been developed which greatly simplified the quantitation of many trace elements and considerably extended their detection range In this context the development of reproducible and accurate techniques for trace element analysis in different media using spectroscopic instrumentation is continuously updated
