Statistical Pattern Recognition Andrew R. Webb, Andrew Webb, 1999 This book provides an introduction to statistical pattern recognition theory and techniques Most of the material presented in this book is concerned with discrimination and classification and has been drawn from a wide range of literature including that of engineering statistics computer science and the social sciences This book is an attempt to provide a concise volume containing descriptions of many of the most useful of today's pattern processing techniques including many of the recent advances in nonparametric approaches to discrimination developed in the statistics literature and elsewhere The techniques are illustrated with examples of real world applications studies Pointers are also provided to the diverse literature base where further details on applications comparative studies and theoretical developments may be obtained Page xv

Pattern Recognition Robert J. Schalkoff, 1992 Explores the heart of pattern recognition concepts methods and applications using statistical syntactic and neural approaches Divided into four sections it clearly demonstrates the similarities and differences among the three approaches The second part deals with the statistical pattern recognition approach starting with a simple example and finishing with unsupervised learning through clustering Section three discusses the syntactic approach and explores such topics as the capabilities of string grammars and parsing higher dimensional representations and graphical approaches Part four presents an excellent overview of the emerging neural approach including an examination of pattern associations and feedforward nets Along with examples each chapter provides the reader with pertinent literature for a more in depth study of specific topics

mathematical disciplines mathematical statistics functional analysis discrete mathematics and information theory This development stage is characterized by successful solution of pattern recognition problems of different physical nature but of the simplest form in the sense of used mathematical models One of the main approaches to solve pattern recognition problems is the statistical approach which uses stochastic models of feature variables Under the statistical approach the first stage of pattern recognition theory development is characterized by the assumption that the probability data model is known exactly or it is estimated from a representative sample of large size with negligible estimation errors Das Gupta 1973 1977 Rey 1978 Vasiljev 1983 **Statistical Pattern Recognition Using Contextual Information** Tai Sen Yu, 1978

Artificial Intelligence with Statistical Pattern Recognition Edward A. Patrick, James M. Fattu, 1986 **Pattern Recognition Approach to Data Interpretation** Diane Wolff, 2012-12-06 An attempt is made in this book to give scientists a detailed working knowledge of the powerful mathematical tools available to aid in data interpretation especially when confronted with large data sets incorporating many parameters A minimal amount of computer knowledge is necessary for successful applications and we have tried conscientiously to provide this in the appropriate sections and references Scientific data are now being produced at rates not believed possible ten years ago A major goal in any scientific investigation should be to obtain a critical evaluation of the data generated in a set of experiments in order to extract whatever useful scientific information may be present Very often the large number of measurements present in the data set does not make this an easy task The goals of this book are thus fourfold The first is to create a useful reference on the applications of these statistical pattern recognition methods to the sciences The majority of our discussions center around the fields of chemistry geology environmental sciences physics and the biological and medical sciences In Chapter IV a section is devoted to each of these fields Since the applications of pattern recognition techniques are essentially unlimited restricted only by the outer limitations of **Statistical Learning and Pattern Analysis for Image and Video Processing** Nanning Zheng, Jianru Xue, 2009-07-25 Why are We Writing This Book Visual data graphical image video and visualized data affect every aspect of modern society The cheap collection storage and transmission of vast amounts of visual data have revolutionized the practice of science technology and business Innovations from various disciplines have been developed and applied to the task of designing intelligent machines that can automatically detect and exploit useful regularities patterns in visual data One such approach to machine intelligence is statistical learning and pattern analysis for visual data Over the past two decades rapid advances have been made throughout the field of visual pattern analysis Some fundamental problems including perceptual grouping image segmentation stereomatching object detection and recognition and motion analysis and visual tracking have become hot research topics and test beds in multiple areas of specialization including mathematics neuron biometry and cognition A great diversity of models and algorithms stemming from these disciplines has been proposed To address the issues of ill posed problems and uncertainties in visual pattern modeling and computing researchers have

developed rich toolkits based on pattern analysis theory harmonic analysis and partial differential equations geometry and group theory graph matching and graph grammars Among these technologies involved in intelligent visual information processing statistical learning and pattern analysis is undoubtedly the most popular and important approach and it is also one of the most rapidly developing fields with many achievements in recent years Above all it provides a unifying theoretical framework for intelligent visual information processing applications
