issues essential to an understanding of Altair radar as well as target tracking systems Kalman filter theory feedback control modulation and demodulation of signals digital sampled data systems digital computer simulation statistical analysis of random signals detection and tracking processes in a radar system are developed first from their rudiments toward a more advanced discussion Offering a breadth of technical detail unusual in the unclassified literature this study is of paramount importance to those involved in tracking applications that use optical signal sonar signal or RF telemetry signals 1989 0 471 50673 7 560 pp Eye Tracking & Detection of Deception Fernando Mendes de Barros,2018 The Concealed Information Test CIT is one of the most scientifically supported techniques of lie detection to date and it is specifically used for detecting individuals knowledge of crime details Advancements in the field of eye tracking research also indicate that pupillometry data could be of value for detection of deception techniques Recognising a research gap regarding the potential benefits of using eye tracking data for detection of concealed information in CIT studies the present study investigated whether eye fixation duration i e dwell time and average pupil size APS could predict individuals attempts to conceal information in a CIT procedure that used mock crime photographs as its primary source of test stimuli A total of 30 participants took part in a mock crime CIT experiment and were assigned to two groups guilty and innocent Guilty participants were required to enact a mock theft whereas innocent participants performed an observation task The CIT had two types of question trials critical and control relevant trials Critical trials presented the simultaneous display of crime relevant and crime irrelevant photographs and correct answers could only be known to guilty participants In control relevant trials the correct answers could only be known to innocent participants and they showed the simultaneous display of control relevant and control irrelevant photographs Results revealed that guilty participants displayed significant increases in APS when responding to both critical and control relevant trials in comparison to innocent participants Moreover neither guilty nor innocent participants displayed significant differences in APS between responses towards relevant and irrelevant photographs Regarding dwell time responses results showed that only guilty participants presented significant decreases in mean dwell time towards relevant i e known photographs compared with irrelevant photographs in critical trials By contrast innocent participants displayed significant increase in dwell time towards relevant photographs in comparison to irrelevant photographs in control relevant trials whereas guilty participants presented significant decrease in dwell time towards relevant photos in these trials These results suggest that guilty participants engaged in avoidance behaviour during the CIT examination and detection of participants attempts to conceal information is possible by targeting guilty participants eye movement patterns Moreover data from innocent participants suggest that innocent participants are less likely to engage in avoidance behaviour during CIT examinations and they may display an orienting response towards known test stimuli instead *Technical Abstract Bulletin* Defense Documentation Center (U.S.),1963 Using Eye-tracking to Understand User Behavior in Deception Detection System Interaction Prashanth Kumar Lakkapragada,2016 This research presents the analysis of data collected

using eye tracking devices on user interaction with a deception detection system The differences between two groups of subjects namely Innocent and Guilty were compared where Innocent subjects did not carry any explosive and hence had nothing to hide in declaring objects that they were carrying whereas Guilty subjects had to lie to deceive the system The results indicate that there is no significant difference in pupil dilation between the Innocent and Guilty subjects However the amount of fixations on the empty spaces of slides containing an explosive image can be used to identify Innocent versus Guilty subjects where subjects in the Guilty condition were more likely than subjects in the Innocent condition to focus on the empty spaces between the images of objects on those slides Abstract page iii
