[An Extensible Component & Connector Architecture Description Infrastructure for Multi-Platform Modeling](#) Andreas Wortmann, 2016-11-08 Software engineering for complex systems requires abstraction multi domain expertise separation of concerns and reuse Domain experts rarely are software engineers and should formulate solutions using their domain's vocabulary instead of general purpose programming languages GPLs Successful integration of domain specific languages DSLs into a software system requires a separation of concerns between domain issues and integration issues while retaining a loose enough coupling to support DSL reuse in different contexts Component based software engineering CBSE increases reuse and separation of concerns by encapsulating functionalities in components Components are GPL artifacts which raises accidental complexities Model driven engineering MDE abstracts from GPLs by lifting models to primary development artifacts Models can be abstract and better comprehensible by using domain vocabulary instead of a GPL They can be platform independent and translated into GPLs for different target platforms Component connector C C architecture description languages ADLs combine CBSE and MDE to compose of architectures from component models We present concepts for engineering software systems with exchangeable component behavior languages The concepts are realized in a software architecture modeling infrastructure that comprises modeling

languages to develop applications based on C C software architectures with exchangeable component behavior DSLs It supports transformations from platform independent to platform specific software architectures and compositional code generation With this it enables domain experts to re use the most appropriate component behavior DSL and facilitates composition of domain solutions through encapsulation in components

Railway Signaling and Communications, 1929 *Bulldog* John Rolfe Ellis, 1986 This thesis explores the problem of exploiting the parallelism available in emerging multiprocessor architectures Ellis contends that high quality compilers can be written for VLIW Very Long Instruction Word computers These machines drive multiple parallel RISCs Reduced Instruction Set Computers with a single instruction stream Each instruction is long enough to command all of the RISCs at once Exploiting the parallelism in VLIW machines can be difficult so Ellis developed a compiler Bulldog that incorporates a number of optimizations It uses trace scheduling to find more parallelism memory reference and memory bank disambiguation to increase memory bandwidth and a new code generation algorithms
