

The Vascular System

What is the vascular system?

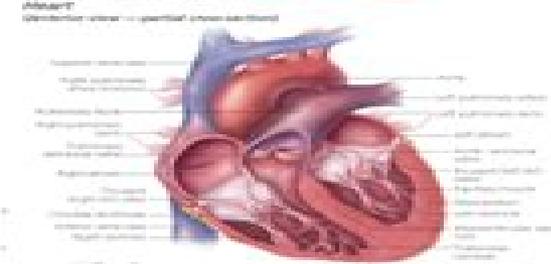

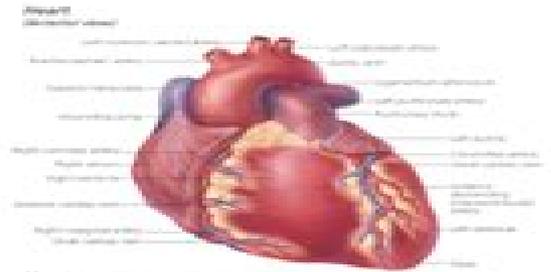

The vascular system is a network of blood vessels that transport blood throughout the body. It consists of the heart, arteries, and veins. The system is responsible for delivering oxygen and nutrients to the body's cells and removing waste products.

Molecular system circulations

Artery	Vein
Thick wall	Thin wall
Narrow lumen	Wide lumen
High pressure	Low pressure
Carries oxygenated blood	Carries deoxygenated blood

The heart

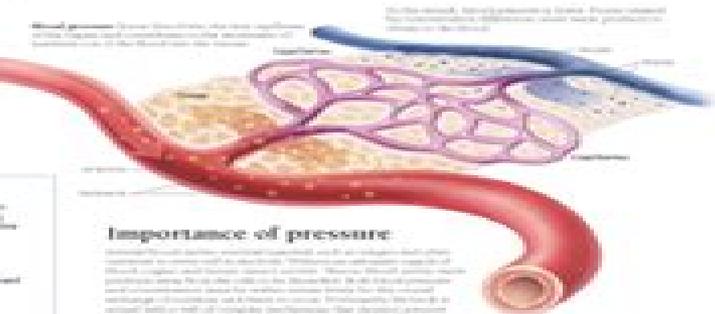

The heart is a muscular organ that pumps blood throughout the body. It consists of four chambers: the right and left atria and ventricles. The heart is located in the chest cavity, between the lungs.

Typical artery (cross-section)

Blood vessels

Blood vessels are the network of tubes that transport blood throughout the body. They are divided into arteries, veins, and capillaries. Arteries carry blood away from the heart, while veins carry blood back to the heart. Capillaries are the smallest blood vessels and are where the exchange of oxygen and nutrients occurs.

Importance of pressure

Blood pressure is the force exerted by the blood against the walls of the blood vessels. It is essential for the flow of blood through the vascular system. High blood pressure can damage the blood vessels and lead to heart disease, while low blood pressure can result in inadequate blood flow to the body's organs.

Arteries and veins

Arteries have a thick wall to allow blood to flow towards the heart and deliver oxygen to the body's tissues. Veins have a thin wall to allow blood to flow back to the heart and collect deoxygenated blood from the body's tissues. The heart pumps blood through the arteries and veins, and the capillaries are where the exchange of oxygen and nutrients occurs.
