Source Coding Theory:

Source Coding Theory Robert M. Gray, 2012-12-06 Source coding theory has as its goal the characterization of the optimal performance achievable in idealized communication systems which must code an information source for transmission over a digital communication or storage channel for transmission to a user. The user must decode the information into a form that is a good approximation to the original. A code is optimal within some class if it achieves the best possible fidelity given whatever constraints are imposed on the code by the available channel. In theory the primary constraint imposed on a code by the channel is its rate or resolution, the number of bits per second or per input symbol that it can transmit from sender to receiver. In the real world complexity may be as important as rate. The origins and the basic form of much of the theory date from Shannon's classical development of noiseless source coding and source coding subject to a fidelity criterion, also called rate distortion theory [73, 74]. Shannon combined a probabilistic notion of information with limit theorems from ergodic theory and a random coding technique to describe the optimal performance of systems with a constrained rate but with unconstrained complexity and delay. An alternative approach called asymptotic or high rate quantization theory based on different techniques and approximations was introduced by Bennett at approximately the same time [4]. This approach constrained the delay but allowed the rate to grow large.

Source Coding Theory Robert M Gray, 1989-10-31 *Distributed Source Coding* Shuang Wang, Yong Fang, Samuel Cheng, 2017-03-20 Distributed source coding is one of the key enablers for efficient cooperative communication. The potential applications range from wireless sensor networks, ad hoc networks and surveillance networks to robust low complexity video coding, stereo Multiview video coding, HDTV, hyper spectral and multispectral imaging and biometrics. The book is divided into three sections: theory, algorithms and applications. Part one covers the background of information theory with an emphasis on DSC. Part two discusses designs of algorithmic solutions for DSC problems covering the three most important DSC problems: Slepian-Wolf, Wyner-Ziv and MT source coding, and part three is dedicated to a variety of potential DSC applications. Key features: Clear explanation of distributed source coding theory and algorithms including both lossless and lossy designs. Rich applications of distributed source coding which covers multimedia communication and data security applications. Self-contained content for beginners from basic information theory to practical code implementation. The book provides fundamental knowledge for engineers and computer scientists to access the topic of distributed source coding. It is also suitable for senior undergraduate and first year graduate students in electrical engineering, computer engineering, signal processing, image/video processing and information theory and communications.

Source Coding Theory Giuseppe Longo, 2014-05-04 **Recursive Source Coding** G. Gabor, Z. Györfi, 2012-12-06 The spreading of digital technology has resulted in a dramatic increase in the demand for data compression. DC methods. At the same time the appearance of highly integrated elements has made more and more complicated algorithms feasible. It is in the fields of speech and image transmission and the transmission and storage of biological signals, e.g. ECG, Body Surface

Mapping where the demand for DC algorithms is greatest There is however a substantial gap between the theory and the practice of DC an essentially nonconstructive information theoretical attitude and the attractive mathematics of source coding theory are contrasted with a mixture of ad hoc engineering methods The classical Shannonian information theory is fundamentally different from the world of practical procedures Theory places great emphasis on block coding while practice is overwhelmingly dominated by theoretically intractable mostly differential predictive coding DPC algorithms A dialogue between theory and practice has been hindered by two profoundly different conceptions of a data source practice mostly because of speech compression considerations favors non stationary models while the theory deals mostly with stationary ones

Digital Communications 1 Didier Le Ruyet, Mylène Pischella, 2015-10-02 The communication chain is constituted by a source and a recipient separated by a transmission channel which may represent a portion of cable an optical fiber a radio channel or a satellite link Whatever the channel the processing blocks implemented in the communication chain have the same foundation This book aims to itemize In this first volume after having presented the base of the information theory we

will study the source coding techniques with and without loss Then we analyze the correcting codes for block errors convolutional and concatenated used in current systems

Mathematics of Information and Coding Te Sun Han, Kingo Kobayashi, 2002 This book is intended to provide engineering and or statistics students communications engineers and mathematicians with the firm theoretic basis of source coding or data compression in information theory Although information theory consists of two main areas source coding and channel coding the authors choose here to focus only on source coding The reason is that in a sense it is more basic than channel coding and also because of recent achievements in source coding and compression An important feature of the book is that whenever possible the authors describe universal coding methods i e the methods that can be used without prior knowledge of the statistical properties of the data The authors approach the subject of source coding from the very basics to the top frontiers in an intuitively transparent but mathematically sound manner The book serves as a theoretical reference for communication professionals and statisticians specializing in information theory It will also serve as an excellent introductory text for advanced level and graduate students taking elementary or advanced courses in telecommunications electrical engineering statistics mathematics and computer science

Source and Channel Coding John B. Anderson, Seshadri Mohan, 2012-12-06 oW should coded communication be approached Is it about prob H ability theorems and bounds or about algorithms and structures The traditional course in information theory and coding teaches these together in one course in which the Shannon theory a probabilistic the ory of information dominates The theory s predictions and bounds to performance are valuable to the coding engineer but coding today is mostly about structures and algorithms and their size speed and error performance While coding has a theoretical basis it has a practical side as well an engineering side in which costs and benefits matter It is safe to say that most of the recent advances in information theory and coding are in the engineering of coding These thoughts motivate the present text book A coded communication book based on methods and algorithms with information theory in a necessary but supporting role There has been much recent progress in coding both in the theory and the practice and these pages report many new advances Chapter 2 covers traditional source coding but also the coding of real one dimensional sources like speech and new techniques like vector quantization Chapter 4 is a unified treatment of trellis codes beginning with binary convolutional codes and passing to the new trellis modulation codes
