Conraths,2022-05-04 Master s Thesis from the year 2018 in the subject Computer Science Applied grade 1 0 RWTH Aachen University Visual Computing Institute language English abstract The goal of this thesis is to provide a texture generation approach that works on cellular textures and enables structural modifications when generating a new output exemplar In the field of computer graphics two dimensional textures are an efficient tool to make a virtual scene richer in detail and therefore visually more appealing Consequently the perceived quality of a rendered image highly depends on the quality of the used textures Unfortunately creating textures by hand is a time consuming task which in extreme cases can only be performed by professional artists On the other hand the use of real photographs often requires post processing steps e g to make them tileable so that there are no visual transitions between multiple texture copies covering a large surface Approaches exist that automatically create new texture variants with different sizes based on a given input sample However most of these methods focus on generating output textures that are as similar to the original input as possible while not allowing for further modifications **Proceedings of the United States National Museum** United States National Museum,1922
