Science Fiction and Posthumanism in the Anthropocene Jonathan Hay,2024-12-26 With science fiction stories imagining futures and worlds vastly different from our own and posthuman philosophies radically reconceptualising our species place within our own world this book is a deep dive into the similarities between science fiction studies and critical posthumanism and how they can be read together Both fields fantasise about future technologies envisage alienness through conversation with everyday life and both anticipate the Anthropocene as a dire source of rupture from the present Drawing inspiration from these and other consonances this book establishes a common theoretical ground between the two fields upon which the two currents of future oriented thought can meet and begin to share a common language An investigation that draws critical currency from the everyday condition of our species in relation to technology and our perilous situation in the Anthropocene the book observes posthumanism not just as a theoretical framework that may be applied to science fictional ideas but also as an integral part of how it is that science fiction is generated Featuring case studies of the work of prominent authors Isaac Asimov Ursula K Le Guin and Kim Stanley Robinson alongside the BBC television series Doctor Who and the cult videogame Outer Wilds *Science Fiction and Posthumanism in the Anthropocene* formulates a new critical paradigm which recognises the value of such works to posthumanist thought Addressing those with an interest in either academic discipline it demonstrates that urgent discourses around our shared future are more imperative now than ever before

Asimov Lewis Jones,1988 Virtual Decomposition Control Wen-Hong Zhu,2010-04-06 Driven by the need to achieve superior control performances for robots with hyper degrees of freedom the virtual decomposition control approach is thoroughly presented in this book This approach uses subsystem such as links and joints of a complex robot dynamics to conduct control design while guaranteeing the stability and convergence of the entire complex robot without compromising the rigorousness of the system analysis The central concept of this approach is the definition of the virtual stability The stability of the entire complex robot is mathematically equivalent to the virtual stability of every subsystem This fact allows us to convert a large problem to a few simple problems with mathematical certainty This book comprises fourteen chapters The first five chapters form the foundation of this approach The remaining nine chapters are relatively independent Starting from Chapter 6 each chapter deals with a particular type of systems including motor transmission assemblies hydraulic robots coordinated multiple robots space robots humanoid robots adaptive teleoperation and modular robot manipulators At the end the extensions of this approach to distributed parameter systems and to electrical circuits are given paving the way for other applications to follow This book is intended for practitioners researchers and graduate students who have acquired fundamental knowledge on robotics and

control systems and have been committed to achieving the best control performances on complex robotics systems and beyond

Dynamic Stabilisation of the Biped Lucy Powered by Actuators with Controllable Stiffness Bram Vanderborght, 2010-09-07 This book reports on the developments of the bipedal walking robot Lucy Special about it is that the biped is not actuated with the classical electrical drives but with pleated pneumatic artificial muscles In an antagonistic setup of such muscles both the torque and the compliance are controllable From human walking there is evidence that joint compliance plays an important role in energy efficient walking and running Moreover pneumatic artificial muscles have a high power to weight ratio and can be coupled directly without complex gearing mechanism which can be beneficial towards legged mechanisms Additionally they have the capability of absorbing impact shocks and store and release motion energy This book gives a complete description of Lucy the hardware the electronics and the software A hybrid simulation program combining the robot dynamics and muscle valve thermodynamics has been written to evaluate control strategies before implementing them in the real biped

Non-Adaptive and Adaptive Control of Manipulation Robots M. Vukobratovic, D. Stokic, N. Kircanski, 2013-12-11 The material presented in this monograph is a logical continuation of research results achieved in the control of manipulation robots This is in a way a synthesis of many year research efforts of the associates of Robotics Department Mihailo Pupin Institute in the field of dynamic control of robotic systems As in Vol 2 of this Series all results rely on the mathematical models of dynamics of active spatial mechanisms which offer the possibility for adequate dynamic control of manipulation robots Compared with Vol 2 this monograph has three essential new characteristics and a variety of new tasks arising in the control of robots which have been formulated and solved for the first time One of these novelties is nonadaptive control synthesized for the case of large variations in payload parameters under the condition that the practical stability of the overall system is satisfied Such a case of control synthesis meets the actual today's needs in industrial robot applications The second characteristic of the monograph is the efficient adaptive control algorithm based on decentralized control structure intended for tasks in which parameter variations cannot be specified in advance To be objective this is not the case in industrial robotics today Thus nonadaptive control with and without a particular parameter variation is supplemented by adaptive dynamic control algorithms which will certainly be applicable in the future industrial practice when parametric identification of workpieces will be required
