**What is cerebrospinal fluid?**

Cerebrospinal fluid (CSF) is a fluid secreted by the choroid plexuses of the ventricles of the brain. It circulates in the ventricles, subarachnoid space and spinal canal. It acts as a shock absorber for the brain, provides nutrients and removes waste. It is a clear, colorless, watery fluid that surrounds the brain and spinal cord, providing cushioning and protecting from infection.

**What is the central nervous system?**

The central nervous system (CNS) consists of the brain and spinal cord. It is responsible for processing and coordinating sensory and motor information. The brain is the main control center, and the spinal cord carries signals between the brain and the rest of the body. The peripheral nervous system (PNS) consists of all the other nerves in the body that connect the CNS to the rest of the body.

**The spinal cord and nerves**

The spinal cord is a long, thin, tube-like structure that runs from the base of the brain down to the lower back. It is made up of a series of segments, each of which contains a pair of spinal nerves. The spinal cord is responsible for carrying sensory information from the rest of the body to the brain, and for carrying motor information from the brain to the rest of the body.

**What are synaptic connections?**

Synaptic connections are the points where neurons meet and communicate. They are formed by the axon terminals of one neuron and the dendrites of another neuron. Synaptic connections allow for the transmission of electrical signals (action potentials) from one neuron to another, which is how information is processed in the brain.

**Neurological disorders**

Changes in the normal function of the brain, spinal cord, or nerves can lead to a wide variety of neurological disorders. These disorders can affect the brain, spinal cord, or nerves, and can cause a wide range of symptoms, including weakness, numbness, and difficulty with memory, behavior, and speech.

**Parkinson's disease**

- A disorder of the movement of the body that produces the neurodegenerative disorder, which requires motor skills.
- Characterized by a loss of dopamine-producing brain cells, leading to tremors, rigidity, and difficulty with posture, balance, and speech.

**Dementia**

- A disorder of the brain that causes a decline in memory, thinking, and personality.
- Characterized by a loss of memory, thinking, and personality.

**Epilepsy**

- A disorder of the brain that causes seizures.
- Characterized by a loss of control over the muscles, leading to convulsions and loss of consciousness.

**Brainstem stroke**

- A stroke that affects the brainstem, which is the part of the brain that controls basic functions like breathing and heart rate.
- Characterized by a loss of control over the muscles, leading to paralysis and loss of consciousness.

**Alzheimer's disease**

- A disorder of the brain that causes memory loss.
- Characterized by a loss of memory, thinking, and personality.
