Time And The Dynamic Control Of Behavior:

Time and the Dynamic Control of Behavior Véronique de Keyser, Géry d' Ydewalle, André Vandierendonck, 1998 The multidisciplinary approach taken here is based on both laboratory and field research in such disciplines as time and work psychology computer science and ergonomics and focuses not only on the underlying mental structures and processes but also on the processes themselves and how individuals can control dynamic situations

Dynamic Decision and Adjustment Processes in Commuter Behavior Under Real-time Information Karthik K. Srinivasan,Hani S. Mahmassani,2002

Advanced Traveler Information Systems ATIS by providing real time traffic information can assist trip makers in selecting efficient travel choices and aid the attainment of desirable system goals including reduced costs and increased efficiencies The success of ATIS in achieving such goals critically depends on user behavior in response to information This research focuses on investigating dynamic aspects in commuter behavior under real time information A dynamic interactive travel behavior simulator that enables a consistent representation of the nonlinear time dependent interactions between network performance trip makers choices and information is used to observe trip maker behavior Using the simulator interactive experiments are conducted where a range of experimental factors including network loading day to day traffic evolution and ATIS information strategies are varied and the consequent trip maker behavior is observed

Constituent models are proposed to analyze the choice dimensions of route departure time and compliance The dynamic kernel logit DKL formulation is presented for analyzing these data and its theoretical and computational suitability established The results confirm the significance of compliance and inertia as key mechanisms influencing route choice

Departure time adjustments appear to be based on a sequential heuristic search

Calibrated models also provide evidence of learning adjustment perception judgment and updating processes in trip maker behavior

Empirical results indicate that real time information and time dependent network conditions are strong determinants of trip maker behavior in a commuting context

The nature and quality of ATIS information accuracy and reliability the magnitude of network loading and its day to day evolution and users past traffic experience are important influences on how commuters select routes and departure times

At the unobserved level general dynamic and stochastic patterns including heterogeneity state dependence habit persistence and correlations are present in trip makers decisions

These substantive results have important implications for network state prediction travel demand forecasting design and evaluation of ATIS services and deployment of Intelligent Transportation System ITS programs User behavior models developed here can be integrated with dynamic network traffic assignment models to obtain more accurate system performance modeling capabilities with considerable applications in tactical and strategic system planning and traffic operations
