Trends and Progress in System Identification Pieter Eykhoff, 2014-05-20 Trends and Progress in System Identification is a three part book that focuses on model considerations identification methods and experimental conditions involved in system identification Organized into 10 chapters this book begins with a discussion of model method in system identification citing four examples differing on the nature of the models involved the nature of the fields and their goals Subsequent chapters describe the most important aspects of model theory the classical methods and time series estimation application of least squares and related techniques for the estimation of dynamic system parameters the maximum likelihood and error prediction methods and the modern development of statistical methods Non parametric approaches identification of nonlinear systems by piecewise approximation and the minimax identification are then explained Other chapters explore the Bayesian approach to system identification choice of input signals and choice and effect of different feedback configurations in system identification This book will be useful for control engineers system scientists biologists and members of other disciplines dealing with dynamical relations
