Scleroderma (progressive Systemic Sclerosis) Alfred John Barnett,1974 *Stem Cell Therapy for Autoimmune Disease* Richard K. Burt,2019-11-11 Stem cell transplantation may be complicated by treatment related mortality and like the immune system that it regenerates has equal potential to either create and preserve or destroy The dual nature that defines stem cells is differentiation that ultimately leads to death and self renewal which leads to immortality What types of stem cells are there How are they collected What are their attributes and characteristics This textbook devotes many chapters to familiarize the reader with the basic science clinical aspects and new questions being raised in the field of stem cell biology Blood stem cells for tolerance and tissue regeneration are a rapidly developing research and clinical field that is being applied to autoimmune diseases In clinical trials autologous hematopoietic blood stem cells are being used to reduce the cytopenic interval following intense immune suppressive transplant regimens While as yet not delineated some possible mechanisms and pathways leading to tolerance after hematopoietic stem cell transplantation are suggested in these chapters Tissue regeneration from blood stem cells is also suggested by animal experiments on stem cell plasticity or metamoiosis i e change in fate as described within this textbook Ongoing early clinical trials on tissue regeneration from blood stem cells are described in the chapter on stem cell therapy for cardiac and peripheral vascular disease Whether autologous hematopoietic stem cells through the process of mobilization and reinfusion may be manipulated to contribute to tissue repair in autoimmune diseases is a future area for translational research

Systemic Sclerosis Ali Nawaz Khan, 2018 Progressive systemic sclerosis scleroderma is a complex multi organ autoimmune connective disease that has protean manifestations although mostly pulmonary other organs are involved in circumstances that manifest as overlap syndromes Progressive systemic sclerosis scleroderma affects adult patients with a female predominance but children are not immune A common theme includes tissue fibrosis and vasculopathy Skin sclerosis is a common occurrence but clinical findings can be associated with skin inflammation fibrosis and vascular changes which are most pronounced in the fingers toes and around the nose and mouth There is variable visceral organ involvement including the esophagus the bowels and the kidneys but vasculitis can affect any organ Any visceral organ including the brain can be affected The extent of system involvement and the variety of clinical presentation makes accurate diagnosis elusive The differentiation between liver disease secondary to connective tissue disorders and primary liver disease such as hepatitis can be extremely challenging since there is a similar immunological mechanism of causation Most patients with connective tissue diseases exhibit liver function abnormalities that likely result from coexisting fatty liver viral hepatitis primary biliary cirrhosis portal hypertension autoimmune hepatitis and hepatic toxicity due to drugs Liver damage whatever the cause can be progressive and ultimately fatal The challenges we face in the diagnosis of liver damage secondary to connective tissue and differentiation from the primary liver disease are challenging Diagnosis is therefore vital whether by invasive or non invasive techniques to institute appropriate management Early reviews of the pathophysiological clinical and pharmacological aspects of scleroderma PSS suggested that the disease was complex of chronic nature and slow in onset The pathophysiological changes are variable affecting the blood vessels the collagen fibers the connective tissues and deposition of fibrin and inflammatory reactions Any fibril containing organs can be affected as well The most common presentations are Raynaud s phenomenon of the extremities mainly the arms and hands vascular inflammation and fibrosis firm facial skin and the limitation of joint movement by pericapsular soft tissue calcification Atrophy of the gastrointestinal tracts smooth muscles

particularly of the gastric cardia is also possible The changes described may cause malabsorption Lung changes are common due to progressive pulmonary fibrosis leading to right sided heart failure and respiratory insufficiency Involvement of the liver kidneys and the endocrine glands are however rare Any organ may be affected but mortality increases when the heart kidney or lungs are affected Various therapeutic regimens have been instituted with variable success including the use of vasodilators corticosteroids and a variety of anti inflammatory agents Some success with excellent therapeutic effects without serious side effects has been achieved
