Signals and Systems Fawwaz Ulaby,Andrew E Yagle,2024-05 From the Preface This is a signals and systems textbook with a difference Engineering applications of signals and systems are integrated into the presentation as equal partners with concepts and mathematical models instead of just presenting the concepts and models and leaving the student to wonder how it all relates to engineering The first six chapters of this textbook cover the usual basic concepts of continuous time signals and systems including the Laplace and Fourier transforms Chapters 7 and 8 present the discrete time version of Chapters 1 6 emphasizing the similarities and analogies and often using continuous time results to derive discrete time results The two chapters serve to introduce the reader to the world of discrete time signals and systems Concepts highlighted in Chapters 1 8 include compensator feedback configuration Ch 4 energy spectral density group delay expanded coverage of exponential Fourier series Ch 5 filtering of images Hilbert transform single sideband SSB zero and first order hold interpolation Ch 6 the Cooley Tukey FFT Ch 7 bilateral z transform and use for non minimum phase deconvolution Ch 8 Chapter 9 covers the usual concepts of discrete time signal processing including data windows FIR and IIR filter design multirate signal processing and auto correlation and crosscorrelation It also includes some nontraditional concepts including spectrograms application of multirate signal processing and the musical circle of fifths to audio signal processing and some biomedical applications of autocorrelation and cross correlation Chapter 10 covers image processing discrete time wavelets including the Smith Barnwell condition and the Haar and Daubechies discrete time wavelet expansions and an introduction to compressed sensing This is the first sophomore junior level textbook the authors are aware of that allows students to apply compressed sensing concepts Applications include image denoising using 2 D filtering image denoising using thresholding

and shrinkage of image wavelet transforms image deconvolution using Wiener filters valid image deconvolution using ISTA image inpainting tomography and the projection slice theorem and image reconstruction from partial knowledge of 2 D DFT values Problems allow students to apply these techniques to actual images and learn by doing not by only reading
