Our voice

Pitch

What makes shallow or low sounds high or low. It is created by the vibration of the vocal cords (and abdominal pressure). High notes, also vibrations produce low notes.

Children usually have high voices because their vocal cords are still short and firm. Consequently, the vocal cords change, especially at age 12. The voice then becomes deeper. This is called the voice break.

In lessons, children practice falling notes gradually. This happens when they sing notes, drop notes or play with the

Breathing

There is no voice without air. When we breathe in, air flows (it pulls in) and when we breathe out, it flows through the larynx. Breathing is the "driving force" for our voice.

Clear, deep breathing helps when singing and speaking. Abdominal breathing is particularly important. The diaphragm expands when you breathe in. This gives the body more air and the voice sounds deeper.

Larynx

The larynx is located in the throat and plays an important role in breathing and coughing. It consists of cartilage and is well protected from the outside. The voice comes from it when you breathe.

The vocal cords are located inside the larynx. When air comes out of the lungs, it causes them to vibrate. This produces a sound. The larynx functions like a small instrument in our body.

At age 12, the larynx grows particularly strongly, during puberty. This is why their voices sound deeper later on. The larynx can be clearly felt in many people if it is called up like "Mama's apple". It is the cartilage plate which can move up and down.

Speaking

Speaking is a special human ability. It comes from the lungs in the form of air. The larynx and other organs in the mouth, nose, lips and palate help to form words.

Language has its own special structure. When we speak, we pay attention to pitch, emphasis, stress and volume. This makes speech understandable and expressive. It enables us to tell a story, negotiate, discuss or explain something.

Good speaking clearly and slowly. This helps when presenting and communicating. Good speakers listen, understand, speak clearly and slowly. It is the message that counts.

Vocal cords

Vocal cords are two thin muscle cords in the larynx. They have to vibrate when air goes in and out when breathing, speaking or singing. When air flows out of the larynx, they begin to vibrate.

The tone changes depending on the tension and length of the vocal cords. If we tense them strongly, the tone sounds higher. If we relax them, the tone becomes deeper. The thickness of the vocal cords

Singing

When creating sounds and melodies with the voice, singing, we hold notes longer and pay attention to tone and feeling. Even small children enjoy singing voluntarily.

Use the body and together when singing. Large, strong vocal cords, larynx and lips. Good posture and concentration help to sing clearly and
