Identification of Dynamic Systems Rolf Isermann,Marco Münchhof,2014-11-23 Precise dynamic models of processes are required for many applications ranging from control engineering to the natural sciences and economics Frequently such precise models cannot be derived using theoretical considerations alone Therefore they must be determined experimentally This book treats the determination of dynamic models based on measurements taken at the process which is known as system identification or process identification Both offline and online methods are presented i e methods that post process the measured data as well as methods that provide models during the measurement The book is theory oriented and application oriented and most methods covered have been used successfully in practical applications for many different processes Illustrative examples in this book with real measured data range from hydraulic and electric actuators up to

combustion engines Real experimental data is also provided on the Springer webpage allowing readers to gather their first experience with the methods presented in this book Among others the book covers the following subjects determination of the non parametric frequency response fast Fourier transform correlation analysis parameter estimation with a focus on the method of Least Squares and modifications identification of time variant processes identification in closed loop identification of continuous time processes and subspace methods Some methods for nonlinear system identification are also considered such as the Extended Kalman filter and neural networks The different methods are compared by using a real three mass oscillator process a model of a drive train For many identification methods hints for the practical implementation and application are provided The book is intended to meet the needs of students and practicing engineers working in research and development design and manufacturing **Federal Register** ,1992-07-27 Scientific and Technical Aerospace Reports ,1992 An Introduction to Identification J. EIV methods that can be used for system identification Readers will explore the properties of an EIV problem Such problems play an important role when the purpose is the determination of the physical laws that describe the process rather than the prediction or control of its future behaviour EIV problems typically occur when the purpose of the modelling is to get physical insight into a process Identifiability of the model parameters for EIV problems is a non trivial issue and sufficient conditions for identifiability are given The author covers various modelling aspects which taken together can find a solution including the characterization of noise properties extension to multivariable systems and continuous time models The book finds solutions that are constituted of methods that are compatible with a set of noisy data which traditional approaches to solutions such as total least squares do not find A number of identification methods for the EIV problem are presented Each method is accompanied with a detailed analysis based on statistical theory and the relationship between the different methods is explained A multitude of methods are covered including instrumental variables methods methods based on bias compensation covariance matching methods and prediction error and maximum likelihood methods The book shows how many of the methods can be applied in either the time or the frequency domain and provides special methods adapted to the case of periodic excitation It concludes with a chapter specifically devoted to practical aspects and user perspectives that will facilitate the transfer of the theoretical material to application in real systems Errors in Variables Methods in System Identification gives readers the possibility of recovering true system dynamics from noisy measurements while solving over determined systems of equations making it suitable for statisticians and mathematicians alike The book also acts as a reference for researchers and computer engineers because of its detailed exploration of EIV problems

System Identification with MATLAB. Linear Models Marvin L., 2016-10-23 In System Identification Toolbox software MATLAB represents linear systems as model objects Model objects are specialized data containers that encapsulate model data and other attributes in a structured way Model objects allow you to manipulate linear systems as single entities rather than keeping track of multiple data vectors matrices or cell arrays Model objects can represent single input single output SISO systems or multiple input multiple output MIMO systems You can represent both continuous and discrete time linear systems The toolbox provides several linear and nonlinear black box model structures which have traditionally been useful for representing dynamic systems This book develops the next tasks with linear models Black Box Modeling Identifying Frequency Response Models Identifying Impulse Response Models Identifying Process Models Identifying Input Output Polynomial Models Identifying State Space Models Identifying Transfer Function Models Refining Linear Parametric Models Refine ARMAX Model with Initial Parameter Guesses at Command Line Refine Initial ARMAX Model at Command Line Extracting Numerical Model Data Transforming Between Discrete Time and Continuous Time Representations Continuous Discrete Conversion Methods Effect of Input Intersample Behavior on Continuous Time Models Transforming Between Linear Model Representations Subreferencing Models Concatenating Models Merging Models Building and Estimating Process Models Using System Identification Toolbox Determining Model Order and Delay 5 Model Structure Selection Determining Model Order and Input Delay Frequency Domain Identification Estimating Models Using Frequency Domain Data Building Structured and User Defined Models Using System Identification Toolbox **Optimized System Identification** Jer-Nan Juang, 1999 In system identification one usually cares most about finding a model whose outputs are as close as possible to the true system outputs when the same input is applied to both However most system identification algorithms do not minimize this output error Often they minimize model equation error instead as in typical least squares fits using a finite difference model and it is seen here that this distinction is significant Here we develop a set of system identification algorithms that minimize output error for multi input multi output and multi input single output systems This is done with sequential quadratic programming iterations on the nonlinear least squares problems with an eigendecomposition to handle indefinite second partials This optimization minimizes a nonlinear function of many variables and hence can converge to local minima To handle this problem we start the iterations from the OKID Observer Kalman Identification algorithm result Not only has OKID proved very effective in practice it minimizes an output error of an observer which has the property that as the data set gets large it converges to minimizing the criterion of interest here Hence it is a particularly good starting point for the nonlinear iterations here Examples show that the methods developed here eliminate the bias that is often observed using any system identification methods of either over estimating or under estimating the damping of vibration modes in lightly damped structures Block-oriented Nonlinear System Identification Fouad Giri, Er-Wei Bai, 2010-08-18 Block oriented

Nonlinear System Identification deals with an area of research that has been very active since the turn of the millennium. The book makes a pedagogical and cohesive presentation of the methods developed in that time. These include iterative and over parameterization techniques, stochastic and frequency approaches, support vector machine, subspace and separable least squares methods, blind identification method, bounded error method, and decoupling inputs approach. The identification methods are presented by authors who have either invented them or contributed significantly to their development. All the important issues, e.g. input design, persistent excitation, and consistency analysis, are discussed. The practical relevance of block-oriented models is illustrated through biomedical physiological system modelling. The book will be of major interest to all those who are concerned with nonlinear system identification, whatever their activity areas. This is particularly the case for educators in electrical, mechanical, chemical, and biomedical engineering, and for practising engineers in process, aeronautic, aerospace, robotics, and vehicles control. Block-oriented Nonlinear System Identification serves as a reference for active researchers, new comers, industrial and education practitioners, and graduate students alike.
