Surface engineering is the general term that incorporates all the techniques by which a surface modification can be accomplished. These techniques include both the more traditional methods such as nitriding, boriding and carburizing and the newer ones such as ion implantation, laser beam melting and in particular coating. This book comprises and compares in a unique way all these techniques of surface engineering. It is a compilation of lectures which were held by renowned scientists and engineers in the frame of the well known EuroCourses of the Joint Research Centre of the Commission of the European Communities. The book is principally addressed to material and surface scientists, physicists and chemists, engineers and technicians of industries and institutes where surface engineering problems arise.

International Workshop On Surface Engineering And Coatings Indira Rajagopal, 1999 *Surface Engineering* Mária Hagarová, Dagmar Jakubéczyová, 2018-04

Introduction to Surface Engineering and Functionally Engineered Materials Peter Martin, 2011-09-06. This book provides a clear and understandable text for users and developers of advanced engineered materials particularly in the area of thin films and addresses fundamentals of modifying the optical, electrical, photo electric, tribological and corrosion resistance of solid surfaces and adding functionality to solids by engineering their surface structure and electronic, magnetic and optical structure. Thin film applications are emphasized. Through the inclusion of multiple clear examples of the technologies, how to use them and the synthesis processes involved, the reader will gain a deep understanding of the purpose, goals and methodology of surface engineering and engineered materials. Virtually every advance in thin film energy, medical, tribological materials technologies has resulted from surface engineering and engineered materials. Surface engineering involves structures and compositions not found naturally in solids and is used to modify the surface properties of solids and involves application of thin film coatings, surface functionalization and activation and plasma treatment. Engineered materials are the future of thin film technology. Engineered structures such as superlattices, nanolaminates, nanotubes, nanocomposites, smart materials, photonic bandgap materials, metamaterials, molecularly doped polymers and structured materials all have the capacity to expand and increase the functionality of thin films and coatings used in a variety of applications and provide new applications. New advanced deposition processes and hybrid processes are being used and developed to deposit advanced thin film materials and structures not possible with conventional techniques a decade ago. Properties can now be engineered into thin films that achieve performance not possible a decade ago.

Surface Engineering for Enhanced Performance against Wear Manish Roy, 2013-04-04. Surface Engineering constitutes a variety of processes and sub processes. Each chapter of this work covers specific processes by experts working in the area. Included for each topic are tribological performances for each process as well as results of recent research. The reader also will benefit from in depth studies of diffusion coatings, nanocomposite films for wear resistance surfaces for biotribological applications, thin film wear tribology of thermal sprayed coatings, hardfacing, plating for tribology and high energy beam surface modifications. Material scientists as well as engineers working with surface engineering for tribology will be particularly interested in this work.
