Computational Structural Concrete Ulrich Häussler-Combe, 2023-01-04 Beton ist aufgrund seiner Vorteile der mit Abstand meistverwendete Baustoff er ist formbar preiswert und überall verfügbar Kombiniert mit Bewehrung bietet dies eine immense Bandbreite an Eigenschaften und kann für eine Vielzahl von Zwecken angepasst werden Damit ist Beton der Baustoff des 20 Jahrhunderts Um der Baustoff des 21 Jahrhunderts zu sein muss seine Nachhaltigkeit in den Fokus rücken Bewehrte Betonkonstruktionen müssen mit geringerem Materialaufwand konstruiert werden wobei ihr Tragfähigkeitspotential optimal ausgeschöpft werden muss Computergestützte Methoden wie die Finite Elemente Methode FEM bieten wesentliche Werkzeuge um das Ziel zu erreichen In Kombination mit experimenteller Validierung ermöglichen sie ein tieferes Verständnis der Tragmechanismen Im Vergleich zu herkömmlichen Ansätzen kann eine realistischere Abschätzung der Grenzzustände der Tragfähigkeit und der Gebrauchstauglichkeit erreicht werden Dies ermöglicht eine deutlich verbesserte Ausnutzung der Baustoffe Damit eröffnet sich auch ein weiterer Horizont für innovative Tragwerksentwürfe Anspruchsvolle numerische Rechenverfahren werden aber in der Regel als Black Boxes bereitgestellt Daten werden eingegeben die Ausgaben ungeprüft

bernommen aber das Verständnis für die dazwischenliegenden Schritte ist oft rudimentär. Dies birgt die Gefahr von Fehlinterpretationen um nicht zu sagen unglücklichen Ergebnissen im Vergleich zu den getroffenen Problemdefinitionen. Das Risiko ist insbesondere bei nichtlinearen Problemen hoch. Bewehrter Beton weist als Verbundmaterial in seinen Grenzzuständen ein nichtlineares Verhalten auf, verursacht durch Verbund- und nichtlineare Eigenschaften seiner Bestandteile. Seine Rissbildung ist ein reguläres Verhalten. In diesem Buch werden die Mechanismen des bewehrten Betons unter dem Blickwinkel numerischer Methoden aufgezeigt. So sollen auch Black Boxes transparent werden. Das Buch beschreibt entsprechende Methoden für Balken, Scheiben, Platten und Schalen im Rahmen von Quasi-Statik und Dynamik. Betonkriechen, Temperatureinwirkungen, Vorspannung, große Verformungen werden beispielhaft behandelt. Weiterhin werden aktuelle Materialmodelle für Beton dargestellt. Dabei werden sowohl die Möglichkeiten als auch die Fallstricke numerischer Methoden aufgezeigt. Die Theorie wird durch eine Vielzahl von Beispielen veranschaulicht. Die meisten von ihnen werden mit dem in Python implementierten und unter Open Source Bedingungen verfügbaren Softwarepaket ConFem durchgeführt.

Structural Concrete Textbook, Volume 4 fib Fédération internationale du béton, 2010-06-01. The second edition of the Structural Concrete Textbook is an extensive revision that reflects advances in knowledge and technology over the past decade. It was prepared in the intermediate period from the CEP FIP Model Code 1990 MC90 to fib Model Code for Concrete Structures 2010 MC2010 and as such incorporates a significant amount of information that has been already finalized for MC2010 while keeping some material from MC90 that was not yet modified considerably. The objective of the textbook is to give detailed information on a wide range of concrete engineering from selection of appropriate structural system and also materials through design and execution and finally behaviour in use. The revised fib Structural Concrete Textbook covers the following main topics: phases of design process, conceptual design, short and long term properties of conventional concrete including creep, shrinkage, fatigue and temperature influences, special types of concretes such as self-compacting concrete, architectural concrete, fibre reinforced concrete, high and ultra high performance concrete, properties of reinforcing and prestressing materials, bond, tension, stiffening, moment, curvature, confining effect, dowel action, aggregate interlock, structural analysis with or without time dependent effects, definition of limit states, control of cracking and deformations, design for moment, shear or torsion, buckling, fatigue, anchorages, splices, detailing, design for durability including service life, design aspects, deterioration, mechanisms, modelling of deterioration, mechanisms, environmental influences, influences of design and execution on durability, fire design including changes in material and structural properties, spalling, degree of deterioration, member design, linear members and slabs with reinforcement layout, deep beams, management, assessment, maintenance, repair including conservation strategies, risk management, types of interventions as well as aspects of execution, quality assurance, formwork and curing. The updated textbook provides the basics of material and structural behaviour and the fundamental knowledge needed for the design, assessment or retrofitting of concrete structures. It will be essential reading.

material for graduate students in the field of structural concrete and also assist designers and consultants in understanding the background to the rules they apply in their practice Furthermore it should prove particularly valuable to users of the new editions of Eurocode 2 for concrete buildings bridges and container structures which are based only partly on MC90 and partly on more recent knowledge which was not included in the 1999 edition of the textbook *fib Model Code for Concrete Structures 2010* fib - fédération internationale du béton,2013-10-01 The International Federation for Structural Concrete fib is a pre normative organization Pre normative implies pioneering work in codification This work has now been realized with the fib Model Code 2010 The objectives of the fib Model Code 2010 are to serve as a basis for future codes for concrete structures and present new developments with regard to concrete structures structural materials and new ideas in order to achieve optimum behaviour The fib Model Code 2010 is now the most comprehensive code on concrete structures including their complete life cycle conceptual design dimensioning construction conservation and dismantlement It is expected to become an important document for both national and international code committees practitioners and researchers The fib Model Code 2010 was produced during the last ten years through an exceptional effort by Joost Walraven Convener Delft University of Technology The Netherlands Agnieszka Bigaj van Vliet Technical Secretary TNO Built Environment and Geosciences The Netherlands as well as experts out of 44 countries from five continents

Ultimate Limit-state Design of Concrete Structures M. D. Kotsovos,M. Pavlovic,1999 Structural concrete members often show great deviation in structural performance from that predicted by the current code of practice In certain cases the predications considerably underestimate the capabilities of a structure or member while in others the predictions are unsafe as they overestimate the member s ability to perform in a prescribed manner Clearly a rational and unified design methodology is still lacking for structural concrete This book presents a simplified methodology based on calculations which are quick easily programmable and no more complex than those required by the current codes It involves identifying the regions of a structural member or structure through which the external load is transmitted from its point of application to the supports and then strengthening these regions as required As most of these regions enclose the trajectories of internal compression actions the technique has been called the compressive force path method Ultimate limit state design for concrete structures will provide designers with a practical and easily applied method for the design of a concrete structure which is fully compatible with the behaviour of concrete as described by valid experimental evidence at both the material and structural level

Shear and Punching Shear in RC and FRC Elements fib Fédération internationale du béton, 2010-12-01 fib Bulletin 57 is a collection of

contributions from a workshop on Recent developments on shear and punching shear in RC and FRC elements held in Sal Italy in October 2010 Shear is one of a few areas of research into fundamentals of the behaviour of concrete structures where contention remains amongst researchers There is a continuing debate between researchers from a structures perspective and those from a materials or fracture mechanics perspective about the mechanisms that enable the force flow through a concrete member and across cracks In 2009 a Working Group was formed within fib Task Group 4.2 Ultimate Limit State Models to harmonise different ideas about design procedures for shear and punching An important outcome of this work was the ensuing discussions between experts and practitioners regarding the shear and punching provisions of the draft fib Model Code which led to the organization of the Sal workshop Invited experts in the field of shear and FRC gave 18 lectures at the workshop that was attended by 72 participants from 12 countries in 3 different continents The contributions from this conference as compiled in this bulletin are believed to represent the best of the current state of knowledge They certainly are of general interest to fib members and especially helpful in the finalization of the 2010 fib Model Code It is hoped that this publication will stimulate further research in the field to refine and harmonize the available analytical models and tools for shear and punching design

Structural Concrete J. D. Davies, 2014-06-05 Structural Concrete examines the behavior of reinforced and prestressed concrete structures under working load and ultimate load conditions This eight chapter text deals first with the analysis of concrete structures as a particular branch of structural mechanics Other chapters explore the empirical methods and the practical design and detailing procedures Considerable chapters describe the mechanical behavior of structural concrete with a particular emphasis on the elastic behavior The final chapters examine the behavior of continuous beams frames and slabs These chapters also look into the models for structural concrete This book is intended primarily to undergraduate civil

engineering students Structural Connections for Precast Concrete Buildings fib Fédération internationale du béton,2008-01-01 Connections are among the most essential parts in precast structures Their performance relates to the structural limit states as well as to manufacture of the precast elements and erection and maintenance of the structure itself Proper design of connections is one major key to a successful prefabrication The principal aim of fib Bulletin 43 is to encourage good practice in the design of structural connections in precast concrete structures This is achieved through a good understanding of structural connections as parts of the overall structural system and of basic force transferring mechanisms The bulletin consists of two parts the first part concerns general considerations and philosophy in the design of structural connections and the second part deals with basic force transferring mechanisms within structural connections The main focus is on the design of structural connections with regard to their structural function in ordinary design situations in the serviceability and ultimate limit states and in accidental abnormal design situations like fire lack of fit and impact accidental loads Other aspects considered include production handling and site erection of elements building physics durability and maintenance Bulletin 43 applies to structural connections for precast concrete buildings although the information on basic force transfer mechanisms can also be applicable to other types of prefabricated structures
