Renewable Energy Powered Desalination Handbook Gnaneswar Gude,2018-03-08 Renewable Energy Powered Desalination Handbook Applications and Thermodynamics offers a practical handbook on the use of renewable technologies to produce freshwater using sustainable methods Sections cover the different renewable technologies currently used in the field including solar wind geothermal and nuclear desalination This coverage is followed by an equally important clear and rigorous discussion of energy recovery and the thermodynamics of desalination processes While seawater desalination can provide a climate independent source of drinking water the process is energy intensive and environmentally damaging This book provides readers with the latest methods processes and technologies available for utilizing renewable energy applications as a valuable technology Desalination based on the use of renewable energy sources can provide a sustainable way to produce fresh water It is expected to become economically attractive as the costs of renewable technologies continue to decline and the prices of fossil fuels continue to increase Covers renewable energy sources such as nuclear geothermal solar and wind powered desalination and energy storage and optimization Includes energy recovery schemes optimization and process controls Elaborates on the principles of thermodynamics and second law efficiencies to improve process performance including solar desalination Explains global applicability of solar wind geothermal and nuclear energy sources with case studies Discusses renewable energy desalinated water optimization schemes for island communities

Energy Resources and Systems Tushar K. Ghosh,Mark A. Prelas,2011-06-27 This second volume of Energy Resources and Systems is focused on renewable energy resources Renewable energy mainly comes from wind solar hydropower geothermal ocean bioenergy ethanol and hydrogen Each of these energy resources is important and

growing For example high head hydroelectric energy is a well established energy resource and already contributes about 20% of the world s electricity Some countries have significant high head resources and produce the bulk of their electrical power by this method However the bulk of the world s high head hydroelectric resources have not been exploited particularly by the underdeveloped countries Low head hydroelectric is unexploited and has the potential to be a growth area Wind energy is the fastest growing of the renewable energy resources for the electricity generation Solar energy is a popular renewable energy resource Geothermal energy is viable near volcanic areas Bioenergy and ethanol have grown in recent years primarily due to changes in public policy meant to encourage its usage Energy policies stimulated the growth of ethanol for example with the unintended side effect of rise in food prices Hydrogen has been pushed as a transportation fuel The authors want to provide a comprehensive series of texts on the interlinking of the nature of energy resources the systems that utilize them the environmental effects the socioeconomic impact the political aspects and governing policies Volume 1 on Fundamentals and Non Renewable Resources was published in 2009 It blends fundamental concepts with an understanding of the non renewable resources that dominate today s society The authors are now working on Volume 3 on nuclear advanced energy resources and nuclear batteries consists of fusion space power systems nuclear energy conversion nuclear batteries and advanced power fuel cells and energy storage Volume 4 will cover environmental effects remediation and policy Solutions to providing long term stable and economical energy is a complex problem which links social economical technical and environmental issues It is the goal of the four volume Energy Resources and Systems series to tell the whole story and provide the background required by students of energy to understand the complex nature of the problem and the importance of linking social economical technical and environmental issues
