Beards, 1996-05-31 Many structures suffer from unwanted vibrations and although careful analysis at the design stage can minimise these the vibration levels of many structures are excessive In this book the entire range of methods of control both by damping and by excitation is described in a single volume Clear and concise descriptions are given of the techniques for mathematically modelling real structures so that the equations which describe the motion of such structures can be derived This approach leads to a comprehensive discussion of the analysis of typical models of vibrating structures excited by a range of periodic and random inputs Careful consideration is also given to the sources of excitation both internal and external and the effects of isolation and transmissibility A major part of the book is devoted to

damping of structures and many sources of damping are considered as are the ways of changing damping using both active and passive methods The numerous worked examples liberally distributed throughout the text amplify and clarify the theoretical analysis presented Particular attention is paid to the meaning and interpretation of results further enhancing the scope and applications of analysis Over 80 problems are included with answers and worked solutions to most This book provides engineering students designers and professional engineers with a detailed insight into the principles involved in the analysis and damping of structural vibration while presenting a sound theoretical basis for further study Suitable for students of engineering to first degree level and for designers and practising engineers Numerous worked examples Clear and easy to follow

A Method of Damping Vibrations in Structural Elements Yu A. LEBEDEV,FOREIGN TECHNOLOGY DIV WRIGHT-PATTERSON AFB OHIO.,1964 A method was devised of damping vibrations in structural elements including the operation of separating them into sections or putting them together out of separate parts and also the operation of creating on the conjugate surfaces of these parts contact pressures which bring into

existence the process of dry friction under strain or vibrations The invention is distinguished by the fact that there is imparted to areas of the part or the structural element one or several curvatures and these are joining into one whole by surfaces bent in different directions *U.S. Government Research & Development Reports* ,1970 *Bibliography of Scientific and Industrial Reports* ,1965 ***International Aerospace Abstracts*** ,1997 ***Second International Symposium on Spacecraft Flight Dynamics*** ,1986 ***Abstract Journal in Earthquake Engineering*** ,1992
