Time Constrained Transaction Management Real Time Constraints In Database Transaction Systems:

Time-Constrained Transaction Management Nandit R. Soparkar, Henry F. Korth, Abraham Silberschatz, 2012-12-06

Transaction processing is an established technique for the concurrent and fault tolerant access of persistent data. While this technique has been successful in standard database systems, factors such as time critical applications, emerging technologies, and a re-examination of existing systems suggest that the performance, functionality, and applicability of transactions may be substantially enhanced if temporal considerations are taken into account. That is, transactions should not only execute in a legal i.e. logically correct manner but they should meet certain constraints with regard to their invocation and completion times. Typically, these logical and temporal constraints are application dependent and we address some fundamental issues for the management of transactions in the presence of such constraints. Our model for transaction processing is based on extensions to established models and we briefly outline how logical and temporal constraints may be expressed in it. For scheduling the transactions, we describe how legal schedules differ from one another in terms of meeting the temporal constraints. Existing scheduling mechanisms do not differentiate among legal schedules and are thereby inadequate with regard to meeting temporal constraints. This provides the basis for seeking scheduling strategies that attempt to meet the temporal constraints while continuing to produce legal schedules.

Time-Constrained Transaction Management Nandit R. Soparkar, Henry F. Korth, Abraham Silberschatz, 1996-09-30. Discusses issues regarding timing estimates, the software and hardware architectures, and the target applications. While the research described is based on a specific model, the results may be generalized to others. The issues raised and the techniques developed represent several fundamental considerations in the management of time constrained transactions. They provide the basis for new directions in research in areas such as database technology, distributed systems, real time systems, fault tolerant systems, and scheduling theory. Motivation: Modern enterprises rely on database management systems (DBMS) to collect, store, and manage corporate data, which is considered a strategic corporate resource. Recently, with the proliferation of personal computers and departmental computing, the trend has been towards the decentralization and distribution of the computing infrastructure, with autonomy and responsibility for data now residing at the departmental and workgroup level of the organization. Users want their data delivered to their desktops, allowing them to incorporate data into their personal databases, spreadsheets, word processing documents, and most importantly, into their daily tasks and activities. They want to be able to share their information while retaining control over its access and distribution. There are also pressures from corporate leaders who wish to use information technology as a strategic resource in offering specialized, value-added services to customers. Database technology

is being used to manage the data associated with corporate processes and activities Increasingly the data being managed are not simply formatted tables in relational databases but all types of objects including unstructured text images audio and video Thus the database management providers are being asked to extend the capabilities of DBMS to include object relational models as well as full object oriented database management systems Advanced Database Indexing Yannis Manolopoulos, Yannis Theodoridis, Vassilis Tsotras, 2012-09-07 Advanced Database Indexing begins by introducing basic material on storage media including magnetic disks RAID systems and tertiary storage such as optical disk and tapes Typical access methods e.g B trees dynamic hash files and secondary key retrieval are also introduced The remainder of the book discusses recent advances in indexing and access methods for particular database applications More specifically issues such as external sorting file structures for intervals temporal access methods spatial and spatio-temporal indexing image and multimedia indexing perfect external hashing methods parallel access methods concurrency issues in indexing and parallel external sorting are presented for the first time in a single book Advanced Database Indexing is an excellent reference for database professionals and may be used as a text for advanced courses on the topic **FY ..
