formal information models in terms of ontologies have evolved as the concept of choice from academia to first industry adoption. However, it has been recognized that the dominant approach of developing a common globally shared ontology as an information model standard has turned out to be limited in real world cross domain environments. Organizational boundaries with regard to consensus degree and the complexity deriving from inherent domain specific differences in requirements force a coexistence of independently managed but however semantic interoperable information models. In order to address this challenge, the guiding idea of this work is to transfer the principle of loose coupling to the semantic level. In particular, the goal of this thesis is to contribute to the reduction of complexity in semantic system integration by developing an effective and efficient approach for semantic interoperability in large scale SOA landscapes based on semantic mediation between loosely coupled information models. Moreover, this work shows how emerging semantic technologies can contribute to the instantiation of this concept, exploiting their capabilities to explicitly express semantics. The developed approach is evaluated based on a case study of an exemplary distributed organization. It is shown how the approach of semantic mediation between loosely coupled information models can be applied in practice and which benefits can be generated with regard to achieving effective and efficient semantic interoperability in large scale SOA landscapes. **Succeeding with SOA** Paul C.

Writing for senior IT developers, strategists, and enterprise architects, the authors cover everything from concepts to implementation requirements to tools. The authors first review the Java EE platform's essential elements in the context of SOA and web services deployment and demonstrate how Java EE has evolved into the world's best open source solution for enterprise SOA. After discussing standards such as SOAP, WSDL, and UDDI, they walk through implementing each key aspect of SOA with Java EE. Step by step, you'll learn how to integrate service oriented web and business components of Java EE technologies with the help of process oriented standards such as BPEL, CDL into a coherent tiered enterprise architecture that can deliver a full spectrum of business services. **Implementing SOA Using Java™ EE** concludes with a section length case study that walks through analyzing a company's requirements, creating an effective SOA architecture, and building a concise proof of concept prototype with NetBeans IDE. Coverage includes using Java EE technologies to simplify SOA implementation, mastering messaging, service descriptions, registries, orchestration, choreography, and other essential SOA concepts.
