

UNDERSTANDING LEUKEMIA

What Is Leukemia?

Leukemia is a group of cancers that starts in the bone marrow and produces too many abnormal white blood cells in the body. The abnormal white blood cells can interfere with the normal function of the bone marrow and can spread to other parts of the body. Leukemia can be treated with chemotherapy, radiation therapy, and stem cell transplantation. Some types of leukemia can be cured, while others are chronic and require ongoing treatment.

Blood Cell Development

Blood cells are produced in the bone marrow, a spongy tissue found in the center of most bones. The process of blood cell formation is called hematopoiesis. It starts with a multipotential hematopoietic stem cell that can give rise to all types of blood cells. As the stem cell divides, it produces more stem cells and also gives rise to different types of blood cells, such as red blood cells, white blood cells, and platelets. The white blood cells are further divided into granulocytes and lymphocytes.

What Is the Function of Blood?

Blood is a complex fluid that carries oxygen and nutrients to the body's cells and removes waste products. It also plays a role in the immune system and in the regulation of body temperature. Blood is composed of red blood cells, white blood cells, and platelets, all suspended in a liquid called plasma.

What Are the Causes and the Risk Factors?

The exact cause of leukemia is still unknown, but several factors are thought to contribute to its development:

- Genetic mutations: Some people have inherited genetic mutations that increase their risk of developing leukemia.
- Environmental factors: Exposure to certain chemicals, such as benzene and radiation, is thought to increase the risk of leukemia.
- Age: The risk of leukemia increases with age, particularly for acute myeloid leukemia (AML) and chronic lymphocytic leukemia (CLL).
- Previous cancer: People who have had a previous cancer, especially if they received chemotherapy or radiation therapy, are at a higher risk of developing a second cancer, including leukemia.

What Are the Treatment Options?

The treatment of leukemia depends on the type and stage of the disease. Treatment options include chemotherapy, radiation therapy, and stem cell transplantation.

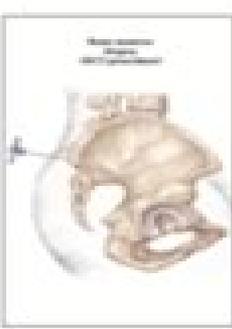

Acute lymphocytic leukemia (ALL): This type of leukemia is most common in children. Treatment typically involves a combination of chemotherapy and radiation therapy. The goal is to achieve remission, which means that the cancer has disappeared. Some people with ALL may have a relapse, which means that the cancer has returned. In some cases, a stem cell transplant may be necessary.

Acute myeloid leukemia (AML): This type of leukemia is most common in older adults. Treatment typically involves a combination of chemotherapy and radiation therapy. The goal is to achieve remission, which means that the cancer has disappeared. Some people with AML may have a relapse, which means that the cancer has returned. In some cases, a stem cell transplant may be necessary.

Chronic lymphocytic leukemia (CLL): This type of leukemia is most common in older adults. Treatment typically involves a combination of chemotherapy and radiation therapy. The goal is to achieve remission, which means that the cancer has disappeared. Some people with CLL may have a relapse, which means that the cancer has returned. In some cases, a stem cell transplant may be necessary.

Chronic myeloid leukemia (CML): This type of leukemia is most common in older adults. Treatment typically involves a combination of chemotherapy and radiation therapy. The goal is to achieve remission, which means that the cancer has disappeared. Some people with CML may have a relapse, which means that the cancer has returned. In some cases, a stem cell transplant may be necessary.

Supportive Care: People with leukemia may need supportive care to help manage symptoms and side effects of treatment. This can include transfusions of red blood cells or platelets, antibiotics to prevent infection, and pain management. Some people may also benefit from counseling and support groups.

Types of Leukemia

Leukemia is grouped into four main types: acute lymphocytic leukemia (ALL), acute myeloid leukemia (AML), chronic lymphocytic leukemia (CLL), and chronic myeloid leukemia (CML). Each type has its own unique characteristics and treatment options.

Acute Lymphocytic Leukemia (ALL)

ALL is the most common type of leukemia in children. It is characterized by the presence of immature lymphocytes in the bone marrow and in the blood.

Signs and Symptoms

- Fatigue
- Fever
- Swollen lymph nodes
- Easy bruising or bleeding
- Bone pain
- Night sweats
- Weight loss

Chronic Lymphocytic Leukemia (CLL)

CLL is the most common type of leukemia in older adults. It is characterized by the presence of mature lymphocytes in the bone marrow and in the blood.

Signs and Symptoms

- Fatigue
- Fever
- Swollen lymph nodes
- Easy bruising or bleeding
- Bone pain
- Night sweats
- Weight loss

Acute Myeloid Leukemia (AML)

AML is the most common type of leukemia in older adults. It is characterized by the presence of immature myeloid cells in the bone marrow and in the blood.

Signs and Symptoms

- Fatigue
- Fever
- Swollen lymph nodes
- Easy bruising or bleeding
- Bone pain
- Night sweats
- Weight loss

Chronic Myeloid Leukemia (CML)

CML is the most common type of leukemia in older adults. It is characterized by the presence of mature myeloid cells in the bone marrow and in the blood.

Signs and Symptoms

- Fatigue
- Fever
- Swollen lymph nodes
- Easy bruising or bleeding
- Bone pain

Diseases and Disorders in Infancy and Early Childhood Janette B. Benson, Marshall M. Haith, 2009-09-14

Currently there are two types of pediatric disorder books available high level technical books geared toward pediatric specialists and self help books for parents The technical books cover diagnosis and treatment while the self help books cover general problems are single authored and speak little to the research of any given disorder This volume consists of focused

articles from the authoritative Encyclopedia of Infant and Early Childhood Development that cover the research information on common disorders in age 0-3. Topics include those most typically occurring making them of great interest to both specialists and nonspecialists. Disorders and dysfunction of a variety of types are discussed whether cognitive, social, emotional, or physiological. Coverage includes asthma, allergies, colic, bedwetting, diarrhea, genetic disorders, SIDS, and learning disabilities and provides an essential, affordable reference for researchers in developmental psychology as well as allied health fields. Written at a level for general understanding, allows for easy and quick grasp of information to both specialists and non-specialists alike. Covers disorders across many systems: neurological, immunological, etc., providing quicker access to info that would normally be dispersed across a wide literature. Written by research experts ensuring accuracy that is sometimes lacking in non-specialist books. Covers disorders, dysfunctions, and abnormal development in one place, saving time looking at multiple sources for these related items.
