Dewdney, 1993 **The Annotated Turing** Charles Petzold, 2008-06-16 Programming Legend Charles Petzold unlocks the secrets of the extraordinary and prescient 1936 paper by Alan M Turing Mathematician Alan Turing invented an imaginary computer known as the Turing Machine in an age before computers he explored the concept of what it meant to be computable creating the field of computability theory in the process a foundation of present day computer programming The book expands Turing s original 36 page paper with additional background chapters and extensive annotations the author elaborates on and clarifies many of Turing s statements making the original difficult to read document accessible to present day programmers computer science majors math geeks and others Interwoven into the narrative are the highlights of Turing s own life his years at Cambridge and Princeton his secret work in cryptanalysis during World War II his involvement in seminal computer projects his speculations about artificial intelligence his arrest and prosecution for the crime of gross indecency and his early death by apparent suicide at the age of 41 *The Multivariate Algorithmic Revolution and Beyond* Hans L. Bodlaender, Rodney Downey, Fedor V. Fomin, Dániel Marx, 2012-06-16 Parameterized complexity is currently a thriving field in complexity theory and algorithm design A significant part of the success of the field can be attributed to Michael R Fellows This Festschrift has been published in honor of Mike Fellows on the occasion of his 60th birthday It contains 20 papers that showcase the important scientific contributions of this remarkable man describes the history of the field of parameterized complexity and also reflects on other parts of Mike Fellows s unique and broad range of interests including his work on the popularization of discrete mathematics for young children The volume contains several surveys that introduce the reader to the field of parameterized complexity and discuss important notions results and developments in this field **Cellular Automata: A Discrete Universe** Andrew Ilachinski, 2001-07-03 Cellular automata are a class of spatially and temporally discrete mathematical systems characterized by local interaction and synchronous dynamical evolution Introduced by the mathematician John von Neumann in the 1950s as simple models of biological self reproduction they are prototypical models for complex systems and processes consisting of a large number of simple homogeneous locally interacting components Cellular automata have been the focus of great attention over the years because of their ability to generate a rich spectrum of very complex patterns of

behavior out of sets of relatively simple underlying rules Moreover they appear to capture many essential features of complex self organizing cooperative behavior observed in real systems This book provides a summary of the basic properties of cellular automata and explores in depth many important cellular automata related research areas including artificial life chaos emergence fractals nonlinear dynamics and self organization It also presents a broad review of the speculative proposition that cellular automata may eventually prove to be theoretical harbingers of a fundamentally new information based discrete physics Designed to be accessible at the junior senior undergraduate level and above the book will be of interest to all students researchers and professionals wanting to learn about order chaos and the emergence of complexity It contains an extensive bibliography and provides a listing of cellular automata resources available on the World Wide Web
