Vision Based Vehicle Guidance:

Vision-based Vehicle Guidance Ichiro Masaki, 2012-12-06 There is a growing social interest in developing vision based vehicle guidance systems for improving traffic safety and efficiency and the environment. Examples of vision based vehicle guidance systems include collision warning systems, steering control systems for tracking painted lane marks and speed control systems for preventing rear end collisions. Like other guidance systems for aircraft and trains, these systems are expected to increase traffic safety significantly. For example, safety improvements of aircraft landing processes after the introduction of automatic guidance systems have been reported to be 100 times better than prior to installment. Although the safety of human lives is beyond price, the cost for automatic guidance could be compensated by decreased insurance costs. It is becoming more important to increase traffic safety by decreasing the human driver's load in our society, especially with an increasing population of senior people who continue to drive. The second potential social benefit is the improvement of traffic efficiency by decreasing the spacing between vehicles without sacrificing safety. It is reported, for example, that four times the efficiency is expected if the spacing between cars is controlled automatically at 90 cm with a speed of 100 km/h compared to today's typical manual driving. Although there are a lot of technical, psychological and social issues to be solved before realizing the high density, high speed traffic systems described here, highly efficient highways are becoming more important because of increasing traffic congestion.

Handbook of Pattern Recognition & Computer Vision Chi-hau Chen, Louis-François Pau, 1999 Annotation Presents the latest research findings in theory, techniques, algorithms and major applications of pattern recognition and computer vision as well as new hardware and architecture aspects. Contains sections on basic methods in pattern recognition and computer vision, nine recognition applications, inspection and robotic applications and architectures and technology. Some areas discussed include cluster analysis, 3D vision of dynamic objects, speech recognition, computer vision in food handling and video content analysis and retrieval. This second edition is extensively revised to describe progress in the field since 1993. Chen is affiliated with the electrical and computer engineering department at the University of Massachusetts Dartmouth. Annotation copyrighted by Book News Inc, Portland, OR.

Stochastically Optimized Monocular Vision-based Navigation and Guidance Yoko Watanabe, 2007 The objective of this thesis is to design a relative navigation and guidance system for unmanned aerial vehicles (UAVs) for vision based control applications. The vision based navigation, guidance and control has been one of the most focused on research topics for the automation of UAVs. This is because in nature, birds and insects use vision as the exclusive sensor for object detection and navigation. In particular, this thesis studies the monocular vision based navigation and guidance. Since 2D vision based measurements are nonlinear with respect to the 3D relative

states an extended Kalman filter EKF is applied in the navigation system design The EKF based navigation system is integrated with a real time image processing algorithm and is tested in simulations and flight tests The first closed loop vision based formation flight has been achieved In addition vision based 3 D terrain recovery was performed in simulations A vision based obstacle avoidance problem is specially addressed in this thesis A navigation and guidance system is designed for a UAV to achieve a mission of waypoint tracking while avoiding unforeseen stationary obstacles by using vision information A 3 D collision criterion is established by using a collision cone approach A minimum effort guidance MEG law is applied for a guidance design and it is shown that the control effort can be reduced by using the MEG based guidance instead of a conventional guidance law The system is evaluated in a 6 DoF flight simulation and also in a flight test For monocular vision based control problems vision based estimation performance highly depends on the relative motion of the vehicle with respect to the target Therefore this thesis aims to derive an optimal guidance law to achieve a given mission under the condition of using the EKF based relative navigation Stochastic optimization is formulated to minimize the expected cost including the guidance error and the control effort A suboptimal guidance law is derived based on an idea of the one step ahead OSA optimization Simulation results show that the suggested guidance law significantly improves the guidance performance Furthermore the OSA optimization is generalized as the n step ahead optimization for an arbitrary number of n and their optimality and computational cost are investigated
